[21293] An enzyme complex designated DICER COMPLEX, dices the GAM1530 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1530 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1530 RNA is designated SEQ ID:4112, and is provided hereinbelow with reference to the sequence listing part.

[21294] GAM1530 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1530 target RNA, herein designated GAM TARGET RNA. GAM1530 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21295] GAM1530 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1530 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1530 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1530 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1530 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21296] The complementary binding of GAM1530 RNA, herein designated GAM RNA, to target binding sites on GAM1530 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1530 target RNA, herein designated GAM TARGET RNA, into GAM1530 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21297] It is appreciated that GAM1530 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1530 target genes. The mRNA of each one of this plurality of GAM1530 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1530 RNA, herein designated GAM RNA, and which when bound by GAM1530 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1530 target proteins.

[21298] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1530 gene, herein designated GAM GENE, on one or more GAM1530 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21299] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1530 correlate with, and may be deduced from, the identity of the target

genes which GAM1530 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21300] Nucleotide sequences of the GAM1530 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1530 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1530 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1530 are further described hereinbelow with reference to Table 1.

[21301] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1530 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21302] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1531 (GAM1531) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21303] GAM1531 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1531 was detected is described hereinabove with reference to Figs. 2-8.

[21304] GAM1531 gene, herein designated GAM GENE, and GAM1531 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[21305] GAM1531 gene, herein designated GAM GENE, encodes a GAM1531 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1531 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1531 precursor RNA is designated SEQ ID:1508, and is provided hereinbelow with reference to the sequence listing part.

[21306] GAM1531 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21307] An enzyme complex designated DICER COMPLEX, dices the GAM1531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1531 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1531 RNA is designated SEQ ID:4114, and is provided

hereinbelow with reference to the sequence listing part.

[21308] GAM1531 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1531 target RNA, herein designated GAM TARGET RNA. GAM1531 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21309] GAM1531 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1531 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1531 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1531 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1531 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21310] The complementary binding of GAM1531 RNA, herein designated GAM RNA, to target binding sites on GAM1531 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1531 target RNA, herein designated GAM TARGET RNA, into GAM1531 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21311] It is appreciated that GAM1531 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1531 target genes. The mRNA of each one of this plurality of GAM1531 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1531 RNA, herein designated GAM RNA, and which when bound by GAM1531 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1531 target proteins.

[21312] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1531 gene, herein designated GAM GENE, on one or more GAM1531 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21313] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1531 correlate with, and may be deduced from, the identity of the target genes which GAM1531 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21314] Nucleotide sequences of the GAM1531 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1531 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1531 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1531 are further described hereinbelow with reference to Table 1.

[21315] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1531 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21316] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1532 (GAM1532) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21317] GAM1532 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1532 was detected is described hereinabove with reference to Figs. 2-8.

[21318] GAM1532 gene, herein designated GAM GENE, and GAM1532 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21319] GAM1532 gene, herein designated GAM GENE, encodes a GAM1532 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1532 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1532 precursor RNA is designated SEQ ID:1509, and is provided hereinbelow with reference to the sequence listing part.

[21320] GAM1532 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1532 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21321] An enzyme complex designated DICER COMPLEX, dices the GAM1532 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1532 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1532 RNA is designated SEQ ID:4113, and is provided hereinbelow with reference to the sequence listing part.

[21322] GAM1532 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1532 target RNA, herein designated GAM TARGET RNA. GAM1532 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21323] GAM1532 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1532 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1532 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1532 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1532 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21324] The complementary binding of GAM1532 RNA, herein designated GAM RNA, to target binding sites on GAM1532 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1532 target RNA, herein designated GAM TARGET RNA, into GAM1532 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21325] It is appreciated that GAM1532 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1532 target genes. The mRNA of each one of this plurality of GAM1532 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1532 RNA, herein designated GAM RNA, and which when bound by GAM1532 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1532 target proteins.

[21326] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1532 gene, herein designated GAM GENE, on one or more GAM1532 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21327] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1532 correlate with, and may be deduced from, the identity of the target genes which GAM1532 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21328] Nucleotide sequences of the GAM1532 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1532 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1532 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1532 are further described hereinbelow with reference to Table 1.

[21329] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1532 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21330] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1533 (GAM1533) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21331] GAM1533 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1533 was detected is described hereinabove with reference to Figs. 2-8.

[21332] GAM1533 gene, herein designated GAM GENE, and GAM1533 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21333] GAM1533 gene, herein designated GAM GENE, encodes a GAM1533 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1533 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1533 precursor RNA is designated SEQ ID:1510, and is provided hereinbelow with reference to the sequence listing part.

[21334] GAM1533 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1533 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21335] An enzyme complex designated DICER COMPLEX, dices the GAM1533 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1533 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1533 RNA is designated SEQ ID:4115, and is provided hereinbelow with reference to the sequence listing part.

[21336] GAM1533 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1533 target RNA, herein designated GAM TARGET RNA. GAM1533 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21337] GAM1533 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1533 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1533 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1533 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1533 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21338] The complementary binding of GAM1533 RNA, herein designated GAM RNA, to target binding sites on GAM1533 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1533 target RNA, herein designated GAM TARGET RNA, into GAM1533 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21339] It is appreciated that GAM1533 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1533 target genes. The mRNA of each one of this plurality of GAM1533 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1533 RNA, herein designated GAM RNA, and which when bound by GAM1533 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1533 target proteins.

[21340] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1533 gene, herein designated GAM GENE, on one or more GAM1533 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21341] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1533 correlate with, and may be deduced from, the identity of the target genes which GAM1533 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21342] Nucleotide sequences of the GAM1533 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1533 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1533 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1533 are further described hereinbelow with reference to Table 1.

[21343] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1533 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[21344] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1534 (GAM1534) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21345] GAM1534 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1534 was detected is described hereinabove with reference to Figs. 2-8.

[21346] GAM1534 gene, herein designated GAM GENE, and GAM1534 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21347] GAM1534 gene, herein designated GAM GENE, encodes a GAM1534 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1534 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1534 precursor RNA is designated SEQ ID:1511, and is provided hereinbelow with reference to the sequence listing part.

[21348] GAM1534 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21349] An enzyme complex designated DICER COMPLEX, dices the GAM1534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1534 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1534 RNA is designated SEQ ID:4117, and is provided hereinbelow with reference to the sequence listing part.

[21350] GAM1534 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1534 target RNA, herein designated GAM TARGET RNA. GAM1534 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21351] GAM1534 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1534 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1534 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1534 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1534 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21352] The complementary binding of GAM1534 RNA, herein designated GAM RNA, to target binding sites on GAM1534 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1534 target RNA, herein designated GAM TARGET RNA, into GAM1534 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21353] It is appreciated that GAM1534 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1534 target genes. The mRNA of each one of this plurality of GAM1534 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1534 RNA, herein designated GAM RNA, and which when bound by GAM1534 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1534 target proteins.

[21354] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1534 gene, herein designated GAM GENE, on one or more GAM1534 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21355] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1534 correlate with, and may be deduced from, the identity of the target genes which GAM1534 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21356] Nucleotide sequences of the GAM1534 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1534 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1534 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1534 are further described hereinbelow with reference to Table 1.

[21357] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1534 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21358] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1535 (GAM1535) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21359] GAM1535 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1535 was detected is described hereinabove with reference to Figs. 2-8.

[21360] GAM1535 gene, herein designated GAM GENE, and GAM1535 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21361] GAM1535 gene, herein designated GAM GENE, encodes a GAM1535 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1535 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1535 precursor RNA is designated SEQ ID:1512, and is provided hereinbelow with reference to the sequence listing part.

[21362] GAM1535 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1535 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21363] An enzyme complex designated DICER COMPLEX, dices the GAM1535 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1535 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1535 RNA is designated SEQ ID:4116, and is provided hereinbelow with reference to the sequence listing part.

[21364] GAM1535 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1535 target RNA, herein designated GAM TARGET RNA. GAM1535 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21365] GAM1535 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1535 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1535 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1535 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1535 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21366] The complementary binding of GAM1535 RNA, herein designated GAM RNA, to target binding sites on GAM1535 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1535 target RNA, herein designated GAM TARGET RNA, into GAM1535 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21367] It is appreciated that GAM1535 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1535 target genes. The

mRNA of each one of this plurality of GAM1535 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1535 RNA, herein designated GAM RNA, and which when bound by GAM1535 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1535 target proteins.

[21368] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1535 gene, herein designated GAM GENE, on one or more GAM1535 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21369] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1535 correlate with, and may be deduced from, the identity of the target genes which GAM1535 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21370] Nucleotide sequences of the GAM1535 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1535 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1535 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1535 are further described hereinbelow with reference to Table 1.

[21371] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1535 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21372] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1536 (GAM1536) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21373] GAM1536 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1536 was detected is described hereinabove with reference to Figs. 2-8.

[21374] GAM1536 gene, herein designated GAM GENE, and GAM1536 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21375] GAM1536 gene, herein designated GAM GENE, encodes a GAM1536 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1536 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1536 precursor RNA is designated SEQ ID:1513, and is provided hereinbelow with reference to the sequence listing part.

[21376] GAM1536 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1536 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21377] An enzyme complex designated DICER COMPLEX, dices the GAM1536 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1536 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1536 RNA is designated SEQ ID:4118, and is provided hereinbelow with reference to the sequence listing part.

[21378] GAM1536 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1536 target RNA, herein designated GAM TARGET RNA. GAM1536 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21379] GAM1536 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1536 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1536 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1536 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1536 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21380] The complementary binding of GAM1536 RNA, herein designated GAM RNA, to target binding sites on GAM1536 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1536 target RNA, herein designated GAM TARGET RNA, into GAM1536 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21381] It is appreciated that GAM1536 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1536 target genes. The mRNA of each one of this plurality of GAM1536 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1536 RNA, herein designated GAM RNA, and which when bound by GAM1536 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1536 target proteins.

[21382] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1536 gene, herein designated GAM GENE, on one or more GAM1536 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21383] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1536 correlate with, and may be deduced from, the identity of the target

genes which GAM1536 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21384] Nucleotide sequences of the GAM1536 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1536 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1536 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1536 are further described hereinbelow with reference to Table 1.

[21385] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1536 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21386] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1537 (GAM1537) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21387] GAM1537 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1537 was detected is described hereinabove with reference to Figs. 2-8.

[21388] GAM1537 gene, herein designated GAM GENE, and GAM1537 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[21389] GAM1537 gene, herein designated GAM GENE, encodes a GAM1537 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1537 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1537 precursor RNA is designated SEQ ID:1514, and is provided hereinbelow with reference to the sequence listing part.

[21390] GAM1537 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1537 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21391] An enzyme complex designated DICER COMPLEX, dices the GAM1537 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1537 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1537 RNA is designated SEQ ID:4120, and is provided

hereinbelow with reference to the sequence listing part.

[21392] GAM1537 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1537 target RNA, herein designated GAM TARGET RNA. GAM1537 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21393] GAM1537 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1537 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1537 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1537 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1537 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21394] The complementary binding of GAM1537 RNA, herein designated GAM RNA, to target binding sites on GAM1537 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1537 target RNA, herein designated GAM TARGET RNA, into GAM1537 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21395] It is appreciated that GAM1537 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1537 target genes. The mRNA of each one of this plurality of GAM1537 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1537 RNA, herein designated GAM RNA, and which when bound by GAM1537 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1537 target proteins.

[21396] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1537 gene, herein designated GAM GENE, on one or more GAM1537 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21397] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1537 correlate with, and may be deduced from, the identity of the target genes which GAM1537 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21398] Nucleotide sequences of the GAM1537 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1537 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1537 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1537 are further described hereinbelow with reference to Table 1.

[21399] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1537 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21400] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1538 (GAM1538) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21401] GAM1538 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1538 was detected is described hereinabove with reference to Figs. 2-8.

[21402] GAM1538 gene, herein designated GAM GENE, and GAM1538 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21403] GAM1538 gene, herein designated GAM GENE, encodes a GAM1538 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1538 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1538 precursor RNA is designated SEQ ID:1515, and is provided hereinbelow with reference to the sequence listing part.

[21404] GAM1538 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21405] An enzyme complex designated DICER COMPLEX, dices the GAM1538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1538 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1538 RNA is designated SEQ ID:4119, and is provided hereinbelow with reference to the sequence listing part.

[21406] GAM1538 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1538 target RNA, herein designated GAM TARGET RNA. GAM1538 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21407] GAM1538 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1538 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1538 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1538 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1538 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21408] The complementary binding of GAM1538 RNA, herein designated GAM RNA, to target binding sites on GAM1538 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1538 target RNA, herein designated GAM TARGET RNA, into GAM1538 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21409] It is appreciated that GAM1538 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1538 target genes. The mRNA of each one of this plurality of GAM1538 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1538 RNA, herein designated GAM RNA, and which when bound by GAM1538 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1538 target proteins.

[21410] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1538 gene, herein designated GAM GENE, on one or more GAM1538 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21411] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1538 correlate with, and may be deduced from, the identity of the target genes which GAM1538 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21412] Nucleotide sequences of the GAM1538 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1538 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1538 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1538 are further described hereinbelow with reference to Table 1.

[21413] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1538 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21414] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1539 (GAM1539) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21415] GAM1539 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1539 was detected is described hereinabove with reference to Figs. 2-8.

[21416] GAM1539 gene, herein designated GAM GENE, and GAM1539 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21417] GAM1539 gene, herein designated GAM GENE, encodes a GAM1539 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1539 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1539 precursor RNA is designated SEQ ID:1516, and is provided hereinbelow with reference to the sequence listing part.

[21418] GAM1539 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21419] An enzyme complex designated DICER COMPLEX, dices the GAM1539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1539 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1539 RNA is designated SEQ ID:4121, and is provided hereinbelow with reference to the sequence listing part.

[21420] GAM1539 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1539 target RNA, herein designated GAM TARGET RNA. GAM1539 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21421] GAM1539 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1539 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1539 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1539 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1539 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21422] The complementary binding of GAM1539 RNA, herein designated GAM RNA, to target binding sites on GAM1539 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1539 target RNA, herein designated GAM TARGET RNA, into GAM1539 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21423] It is appreciated that GAM1539 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1539 target genes. The mRNA of each one of this plurality of GAM1539 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1539 RNA, herein designated GAM RNA, and which when bound by GAM1539 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1539 target proteins.

[21424] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1539 gene, herein designated GAM GENE, on one or more GAM1539 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21425] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1539 correlate with, and may be deduced from, the identity of the target genes which GAM1539 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21426] Nucleotide sequences of the GAM1539 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1539 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1539 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1539 are further described hereinbelow with reference to Table 1.

[21427] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1539 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21428] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1540 (GAM1540) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21429] GAM1540 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1540 was detected is described hereinabove with reference to Figs. 2-8.

[21430] GAM1540 gene, herein designated GAM GENE, and GAM1540 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21431] GAM1540 gene, herein designated GAM GENE, encodes a GAM1540 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1540 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1540 precursor RNA is designated SEQ ID:1517, and is provided hereinbelow with reference to the sequence listing part.

[21432] GAM1540 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1540 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21433] An enzyme complex designated DICER COMPLEX, dices the GAM1540 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1540 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1540 RNA is designated SEQ ID:4122, and is provided hereinbelow with reference to the sequence listing part.

[21434] GAM1540 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1540 target RNA, herein designated GAM TARGET RNA. GAM1540 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21435] GAM1540 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1540 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1540 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1540 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1540 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[21436] The complementary binding of GAM1540 RNA, herein designated GAM RNA, to target binding sites on GAM1540 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1540 target RNA, herein designated GAM TARGET RNA, into GAM1540 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21437] It is appreciated that GAM1540 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1540 target genes. The mRNA of each one of this plurality of GAM1540 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1540 RNA, herein designated GAM RNA, and which when bound by GAM1540 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1540 target proteins.

[21438] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1540 gene, herein designated GAM GENE, on one or more GAM1540 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21439] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1540 correlate with, and may be deduced from, the identity of the target genes which GAM1540 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21440] Nucleotide sequences of the GAM1540 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1540 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1540 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1540 are further described hereinbelow with reference to Table 1.

[21441] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1540 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21442] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1541 (GAM1541) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21443] GAM1541 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1541 was detected is described hereinabove with reference to Figs. 2-8.

[21444] GAM1541 gene, herein designated GAM GENE, and GAM1541 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21445] GAM1541 gene, herein designated GAM GENE, encodes a GAM1541 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1541 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1541 precursor RNA is designated SEQ ID:1518, and is provided hereinbelow with reference to the sequence listing part.

[21446] GAM1541 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21447] An enzyme complex designated DICER COMPLEX, dices the GAM1541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1541 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1541 RNA is designated SEQ ID:4123, and is provided hereinbelow with reference to the sequence listing part.

[21448] GAM1541 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1541 target RNA, herein designated GAM TARGET RNA. GAM1541 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21449] GAM1541 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1541 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1541 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1541 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1541 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21450] The complementary binding of GAM1541 RNA, herein designated GAM RNA, to target binding sites on GAM1541 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1541 target RNA, herein designated GAM TARGET RNA, into GAM1541 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21451] It is appreciated that GAM1541 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1541 target genes. The mRNA of each one of this plurality of GAM1541 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1541 RNA, herein designated GAM RNA, and which when bound by GAM1541 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1541 target proteins.

[21452] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1541 gene, herein designated GAM GENE, on one or more GAM1541 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21453] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1541 correlate with, and may be deduced from, the identity of the target genes which GAM1541 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21454] Nucleotide sequences of the GAM1541 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1541 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1541 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1541 are further described hereinbelow with reference to Table 1.

[21455] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1541 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21456] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 1542 (GAM1542) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21457] GAM1542 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1542 was detected is described hereinabove with reference to Figs. 2-8.

[21458] GAM1542 gene, herein designated GAM GENE, and GAM1542 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21459] GAM1542 gene, herein designated GAM GENE, encodes a GAM1542 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1542 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1542 precursor RNA is designated SEQ ID:1519, and is provided hereinbelow with reference to the sequence listing part.

[21460] GAM1542 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21461] An enzyme complex designated DICER COMPLEX, dices the GAM1542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1542 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1542 RNA is designated SEQ ID:4124, and is provided hereinbelow with reference to the sequence listing part.

[21462] GAM1542 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1542 target RNA, herein designated GAM TARGET RNA. GAM1542 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21463] GAM1542 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1542 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1542 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1542 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1542 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21464] The complementary binding of GAM1542 RNA, herein designated GAM RNA, to target binding sites on GAM1542 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1542 target RNA, herein designated GAM TARGET RNA, into GAM1542 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21465] It is appreciated that GAM1542 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1542 target genes. The mRNA of each one of this plurality of GAM1542 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1542 RNA, herein designated GAM RNA, and which when bound by GAM1542 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1542 target proteins.

[21466] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1542 gene, herein designated GAM GENE, on one or more GAM1542 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21467] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1542 correlate with, and may be deduced from, the identity of the target genes which GAM1542 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21468] Nucleotide sequences of the GAM1542 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1542 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1542 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1542 are further described hereinbelow with reference to Table 1.

[21469] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1542 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[21470] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1543 (GAM1543) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21471] GAM1543 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1543 was detected is described hereinabove with reference to Figs. 2-8.

[21472] GAM1543 gene, herein designated GAM GENE, and GAM1543 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21473] GAM1543 gene, herein designated GAM GENE, encodes a GAM1543 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1543 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1543 precursor RNA is designated SEQ ID:1520, and is provided hereinbelow with reference to the sequence listing part.

[21474] GAM1543 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21475] An enzyme complex designated DICER COMPLEX, dices the GAM1543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1543 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1543 RNA is designated SEQ ID:4125, and is provided hereinbelow with reference to the sequence listing part.

[21476] GAM1543 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1543 target RNA, herein designated GAM TARGET RNA. GAM1543 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21477] GAM1543 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1543 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1543 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1543 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1543 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21478] The complementary binding of GAM1543 RNA, herein designated GAM RNA, to target binding sites on GAM1543 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1543 target RNA, herein designated GAM TARGET RNA, into GAM1543 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21479] It is appreciated that GAM1543 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1543 target genes. The mRNA of each one of this plurality of GAM1543 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1543 RNA, herein designated GAM RNA, and which when bound by GAM1543 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1543 target proteins.

[21480] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1543 gene, herein designated GAM GENE, on one or more GAM1543 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21481] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1543 correlate with, and may be deduced from, the identity of the target genes which GAM1543 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21482] Nucleotide sequences of the GAM1543 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1543 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1543 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1543 are further described hereinbelow with reference to Table 1.

[21483] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1543 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21484] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1544 (GAM1544) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21485] GAM1544 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1544 was detected is described hereinabove with reference to Figs. 2-8.

[21486] GAM1544 gene, herein designated GAM GENE, and GAM1544 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21487] GAM1544 gene, herein designated GAM GENE, encodes a GAM1544 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1544 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1544 precursor RNA is designated SEQ ID:1521, and is provided hereinbelow with reference to the sequence listing part.

[21488] GAM1544 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21489] An enzyme complex designated DICER COMPLEX, dices the GAM1544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1544 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1544 RNA is designated SEQ ID:4126, and is provided hereinbelow with reference to the sequence listing part.

[21490] GAM1544 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1544 target RNA, herein designated GAM TARGET RNA. GAM1544 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21491] GAM1544 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1544 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1544 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1544 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1544 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21492] The complementary binding of GAM1544 RNA, herein designated GAM RNA, to target binding sites on GAM1544 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1544 target RNA, herein designated GAM TARGET RNA, into GAM1544 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21493] It is appreciated that GAM1544 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1544 target genes. The

mRNA of each one of this plurality of GAM1544 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1544 RNA, herein designated GAM RNA, and which when bound by GAM1544 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1544 target proteins.

[21494] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1544 gene, herein designated GAM GENE, on one or more GAM1544 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21495] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1544 correlate with, and may be deduced from, the identity of the target genes which GAM1544 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21496] Nucleotide sequences of the GAM1544 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1544 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1544 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1544 are further described hereinbelow with reference to Table 1.

[21497] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1544 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21498] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1545 (GAM1545) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21499] GAM1545 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1545 was detected is described hereinabove with reference to Figs. 2-8.

[21500] GAM1545 gene, herein designated GAM GENE, and GAM1545 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21501] GAM1545 gene, herein designated GAM GENE, encodes a GAM1545 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1545 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1545 precursor RNA is designated SEQ ID:1522, and is provided hereinbelow with reference to the sequence listing part.

[21502] GAM1545 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1545 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21503] An enzyme complex designated DICER COMPLEX, dices the GAM1545 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1545 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1545 RNA is designated SEQ ID:4127, and is provided hereinbelow with reference to the sequence listing part.

[21504] GAM1545 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1545 target RNA, herein designated GAM TARGET RNA. GAM1545 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21505] GAM1545 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1545 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1545 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1545 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1545 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21506] The complementary binding of GAM1545 RNA, herein designated GAM RNA, to target binding sites on GAM1545 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1545 target RNA, herein designated GAM TARGET RNA, into GAM1545 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21507] It is appreciated that GAM1545 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1545 target genes. The mRNA of each one of this plurality of GAM1545 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1545 RNA, herein designated GAM RNA, and which when bound by GAM1545 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1545 target proteins.

[21508] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1545 gene, herein designated GAM GENE, on one or more GAM1545 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21509] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1545 correlate with, and may be deduced from, the identity of the target

genes which GAM1545 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21510] Nucleotide sequences of the GAM1545 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1545 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1545 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1545 are further described hereinbelow with reference to Table 1.

[21511] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1545 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21512] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1546 (GAM1546) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21513] GAM1546 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1546 was detected is described hereinabove with reference to Figs. 2-8.

[21514] GAM1546 gene, herein designated GAM GENE, and GAM1546 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[21515] GAM1546 gene, herein designated GAM GENE, encodes a GAM1546 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1546 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1546 precursor RNA is designated SEQ ID:1523, and is provided hereinbelow with reference to the sequence listing part.

[21516] GAM1546 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21517] An enzyme complex designated DICER COMPLEX, dices the GAM1546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1546 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1546 RNA is designated SEQ ID:4128, and is provided

hereinbelow with reference to the sequence listing part.

[21518] GAM1546 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1546 target RNA, herein designated GAM TARGET RNA. GAM1546 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21519] GAM1546 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1546 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1546 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1546 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1546 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21520] The complementary binding of GAM1546 RNA, herein designated GAM RNA, to target binding sites on GAM1546 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1546 target RNA, herein designated GAM TARGET RNA, into GAM1546 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21521] It is appreciated that GAM1546 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1546 target genes. The mRNA of each one of this plurality of GAM1546 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1546 RNA, herein designated GAM RNA, and which when bound by GAM1546 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1546 target proteins.

[21522] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1546 gene, herein designated GAM GENE, on one or more GAM1546 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21523] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1546 correlate with, and may be deduced from, the identity of the target genes which GAM1546 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21524] Nucleotide sequences of the GAM1546 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1546 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1546 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1546 are further described hereinbelow with reference to Table 1.

[21525] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1546 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21526] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1547 (GAM1547) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21527] GAM1547 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1547 was detected is described hereinabove with reference to Figs. 2-8.

[21528] GAM1547 gene, herein designated GAM GENE, and GAM1547 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21529] GAM1547 gene, herein designated GAM GENE, encodes a GAM1547 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1547 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1547 precursor RNA is designated SEQ ID:1524, and is provided hereinbelow with reference to the sequence listing part.

[21530] GAM1547 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1547 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21531] An enzyme complex designated DICER COMPLEX, dices the GAM1547 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1547 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1547 RNA is designated SEQ ID:4129, and is provided hereinbelow with reference to the sequence listing part.

[21532] GAM1547 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1547 target RNA, herein designated GAM TARGET RNA. GAM1547 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21533] GAM1547 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1547 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1547 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1547 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1547 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21534] The complementary binding of GAM1547 RNA, herein designated GAM RNA, to target binding sites on GAM1547 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1547 target RNA, herein designated GAM TARGET RNA, into GAM1547 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21535] It is appreciated that GAM1547 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1547 target genes. The mRNA of each one of this plurality of GAM1547 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1547 RNA, herein designated GAM RNA, and which when bound by GAM1547 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1547 target proteins.

[21536] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1547 gene, herein designated GAM GENE, on one or more GAM1547 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21537] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1547 correlate with, and may be deduced from, the identity of the target genes which GAM1547 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21538] Nucleotide sequences of the GAM1547 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1547 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1547 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1547 are further described hereinbelow with reference to Table 1.

[21539] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1547 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21540] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1548 (GAM1548) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21541] GAM1548 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1548 was detected is described hereinabove with reference to Figs. 2-8.

[21542] GAM1548 gene, herein designated GAM GENE, and GAM1548 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21543] GAM1548 gene, herein designated GAM GENE, encodes a GAM1548 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1548 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1548 precursor RNA is designated SEQ ID:1525, and is provided hereinbelow with reference to the sequence listing part.

[21544] GAM1548 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21545] An enzyme complex designated DICER COMPLEX, dices the GAM1548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1548 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1548 RNA is designated SEQ ID:4130, and is provided hereinbelow with reference to the sequence listing part.

[21546] GAM1548 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1548 target RNA, herein designated GAM TARGET RNA. GAM1548 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21547] GAM1548 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1548 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1548 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1548 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1548 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21548] The complementary binding of GAM1548 RNA, herein designated GAM RNA, to target binding sites on GAM1548 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1548 target RNA, herein designated GAM TARGET RNA, into GAM1548 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21549] It is appreciated that GAM1548 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1548 target genes. The mRNA of each one of this plurality of GAM1548 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1548 RNA, herein designated GAM RNA, and which when bound by GAM1548 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1548 target proteins.

[21550] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1548 gene, herein designated GAM GENE, on one or more GAM1548 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21551] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1548 correlate with, and may be deduced from, the identity of the target genes which GAM1548 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21552] Nucleotide sequences of the GAM1548 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1548 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1548 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1548 are further described hereinbelow with reference to Table 1.

[21553] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1548 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[21554] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1549 (GAM1549) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21555] GAM1549 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1549 was detected is described hereinabove with reference to Figs. 2-8.

[21556] GAM1549 gene, herein designated GAM GENE, and GAM1549 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21557] GAM1549 gene, herein designated GAM GENE, encodes a GAM1549 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1549 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1549 precursor RNA is designated SEQ ID:1526, and is provided hereinbelow with reference to the sequence listing part.

[21558] GAM1549 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21559] An enzyme complex designated DICER COMPLEX, dices the GAM1549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1549 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1549 RNA is designated SEQ ID:4131, and is provided hereinbelow with reference to the sequence listing part.

[21560] GAM1549 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1549 target RNA, herein designated GAM TARGET RNA. GAM1549 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21561] GAM1549 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1549 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1549 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1549 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1549 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21562] The complementary binding of GAM1549 RNA, herein designated GAM RNA, to target binding sites on GAM1549 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1549 target RNA, herein designated GAM TARGET RNA, into GAM1549 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21563] It is appreciated that GAM1549 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1549 target genes. The mRNA of each one of this plurality of GAM1549 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1549 RNA, herein designated GAM RNA, and which when bound by GAM1549 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1549 target proteins.

[21564] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1549 gene, herein designated GAM GENE, on one or more GAM1549 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21565] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1549 correlate with, and may be deduced from, the identity of the target genes which GAM1549 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21566] Nucleotide sequences of the GAM1549 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1549 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1549 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1549 are further described hereinbelow with reference to Table 1.

[21567] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1549 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21568] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1550 (GAM1550) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21569] GAM1550 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1550 was detected is described hereinabove with reference to Figs. 2-8.

[21570] GAM1550 gene, herein designated GAM GENE, and GAM1550 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21571] GAM1550 gene, herein designated GAM GENE, encodes a GAM1550 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1550 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1550 precursor RNA is designated SEQ ID:1527, and is provided hereinbelow with reference to the sequence listing part.

[21572] GAM1550 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21573] An enzyme complex designated DICER COMPLEX, dices the GAM1550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1550 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1550 RNA is designated SEQ ID:4132, and is provided hereinbelow with reference to the sequence listing part.

[21574] GAM1550 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1550 target RNA, herein designated GAM TARGET RNA. GAM1550 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21575] GAM1550 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1550 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1550 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1550 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1550 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21576] The complementary binding of GAM1550 RNA, herein designated GAM RNA, to target binding sites on GAM1550 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1550 target RNA, herein designated GAM TARGET RNA, into GAM1550 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21577] It is appreciated that GAM1550 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1550 target genes. The

mRNA of each one of this plurality of GAM1550 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1550 RNA, herein designated GAM RNA, and which when bound by GAM1550 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1550 target proteins.

[21578] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1550 gene, herein designated GAM GENE, on one or more GAM1550 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21579] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1550 correlate with, and may be deduced from, the identity of the target genes which GAM1550 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21580] Nucleotide sequences of the GAM1550 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1550 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1550 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1550 are further described hereinbelow with reference to Table 1.

[21581] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1550 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21582] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1551 (GAM1551) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21583] GAM1551 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1551 was detected is described hereinabove with reference to Figs. 2-8.

[21584] GAM1551 gene, herein designated GAM GENE, and GAM1551 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21585] GAM1551 gene, herein designated GAM GENE, encodes a GAM1551 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1551 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1551 precursor RNA is designated SEQ ID:1528, and is provided hereinbelow with reference to the sequence listing part.

[21586] GAM1551 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1551 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21587] An enzyme complex designated DICER COMPLEX, dices the GAM1551 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1551 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1551 RNA is designated SEQ ID:4133, and is provided hereinbelow with reference to the sequence listing part.

[21588] GAM1551 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1551 target RNA, herein designated GAM TARGET RNA. GAM1551 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21589] GAM1551 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1551 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1551 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1551 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1551 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21590] The complementary binding of GAM1551 RNA, herein designated GAM RNA, to target binding sites on GAM1551 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1551 target RNA, herein designated GAM TARGET RNA, into GAM1551 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21591] It is appreciated that GAM1551 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1551 target genes. The mRNA of each one of this plurality of GAM1551 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1551 RNA, herein designated GAM RNA, and which when bound by GAM1551 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1551 target proteins.

[21592] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1551 gene, herein designated GAM GENE, on one or more GAM1551 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21593] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1551 correlate with, and may be deduced from, the identity of the target

genes which GAM1551 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21594] Nucleotide sequences of the GAM1551 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1551 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1551 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1551 are further described hereinbelow with reference to Table 1.

[21595] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1551 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21596] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1552 (GAM1552) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21597] GAM1552 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1552 was detected is described hereinabove with reference to Figs. 2-8.

[21598] GAM1552 gene, herein designated GAM GENE, and GAM1552 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[21599] GAM1552 gene, herein designated GAM GENE, encodes a GAM1552 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1552 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1552 precursor RNA is designated SEQ ID:1529, and is provided hereinbelow with reference to the sequence listing part.

[21600] GAM1552 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21601] An enzyme complex designated DICER COMPLEX, dices the GAM1552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1552 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1552 RNA is designated SEQ ID:4134, and is provided

hereinbelow with reference to the sequence listing part.

[21602] GAM1552 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1552 target RNA, herein designated GAM TARGET RNA. GAM1552 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21603] GAM1552 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1552 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1552 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1552 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1552 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21604] The complementary binding of GAM1552 RNA, herein designated GAM RNA, to target binding sites on GAM1552 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1552 target RNA, herein designated GAM TARGET RNA, into GAM1552 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21605] It is appreciated that GAM1552 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1552 target genes. The mRNA of each one of this plurality of GAM1552 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1552 RNA, herein designated GAM RNA, and which when bound by GAM1552 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1552 target proteins.

[21606] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1552 gene, herein designated GAM GENE, on one or more GAM1552 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21607] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1552 correlate with, and may be deduced from, the identity of the target genes which GAM1552 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21608] Nucleotide sequences of the GAM1552 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1552 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1552 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1552 are further described hereinbelow with reference to Table 1.

[21609] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1552 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21610] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1553 (GAM1553) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21611] GAM1553 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1553 was detected is described hereinabove with reference to Figs. 2-8.

[21612] GAM1553 gene, herein designated GAM GENE, and GAM1553 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21613] GAM1553 gene, herein designated GAM GENE, encodes a GAM1553 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1553 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1553 precursor RNA is designated SEQ ID:1530, and is provided hereinbelow with reference to the sequence listing part.

[21614] GAM1553 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21615] An enzyme complex designated DICER COMPLEX, dices the GAM1553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1553 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1553 RNA is designated SEQ ID:4135, and is provided hereinbelow with reference to the sequence listing part.

[21616] GAM1553 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1553 target RNA, herein designated GAM TARGET RNA. GAM1553 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21617] GAM1553 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1553 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1553 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1553 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1553 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21618] The complementary binding of GAM1553 RNA, herein designated GAM RNA, to target binding sites on GAM1553 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1553 target RNA, herein designated GAM TARGET RNA, into GAM1553 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21619] It is appreciated that GAM1553 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1553 target genes. The mRNA of each one of this plurality of GAM1553 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1553 RNA, herein designated GAM RNA, and which when bound by GAM1553 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1553 target proteins.

[21620] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1553 gene, herein designated GAM GENE, on one or more GAM1553 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21621] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1553 correlate with, and may be deduced from, the identity of the target genes which GAM1553 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21622] Nucleotide sequences of the GAM1553 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1553 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1553 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1553 are further described hereinbelow with reference to Table 1.

[21623] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1553 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21624] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1554 (GAM1554) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21625] GAM1554 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1554 was detected is described hereinabove with reference to Figs. 2-8.

[21626] GAM1554 gene, herein designated GAM GENE, and GAM1554 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21627] GAM1554 gene, herein designated GAM GENE, encodes a GAM1554 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1554 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1554 precursor RNA is designated SEQ ID:1531, and is provided hereinbelow with reference to the sequence listing part.

[21628] GAM1554 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1554 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21629] An enzyme complex designated DICER COMPLEX, dices the GAM1554 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1554 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1554 RNA is designated SEQ ID:4136, and is provided hereinbelow with reference to the sequence listing part.

[21630] GAM1554 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1554 target RNA, herein designated GAM TARGET RNA. GAM1554 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21631] GAM1554 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1554 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1554 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1554 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1554 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21632] The complementary binding of GAM1554 RNA, herein designated GAM RNA, to target binding sites on GAM1554 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1554 target RNA, herein designated GAM TARGET RNA, into GAM1554 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21633] It is appreciated that GAM1554 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1554 target genes. The mRNA of each one of this plurality of GAM1554 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1554 RNA, herein designated GAM RNA, and which when bound by GAM1554 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1554 target proteins.

[21634] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1554 gene, herein designated GAM GENE, on one or more GAM1554 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21635] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1554 correlate with, and may be deduced from, the identity of the target genes which GAM1554 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21636] Nucleotide sequences of the GAM1554 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1554 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1554 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1554 are further described hereinbelow with reference to Table 1.

[21637] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1554 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[21638] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1555 (GAM1555) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21639] GAM1555 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1555 was detected is described hereinabove with reference to Figs. 2-8.

[21640] GAM1555 gene, herein designated GAM GENE, and GAM1555 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21641] GAM1555 gene, herein designated GAM GENE, encodes a GAM1555 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1555 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1555 precursor RNA is designated SEQ ID:1532, and is provided hereinbelow with reference to the sequence listing part.

[21642] GAM1555 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1555 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21643] An enzyme complex designated DICER COMPLEX, dices the GAM1555 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1555 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1555 RNA is designated SEQ ID:4137, and is provided hereinbelow with reference to the sequence listing part.

[21644] GAM1555 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1555 target RNA, herein designated GAM TARGET RNA. GAM1555 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21645] GAM1555 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1555 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1555 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1555 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1555 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21646] The complementary binding of GAM1555 RNA, herein designated GAM RNA, to target binding sites on GAM1555 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1555 target RNA, herein designated GAM TARGET RNA, into GAM1555 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21647] It is appreciated that GAM1555 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1555 target genes. The mRNA of each one of this plurality of GAM1555 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1555 RNA, herein designated GAM RNA, and which when bound by GAM1555 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1555 target proteins.

[21648] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1555 gene, herein designated GAM GENE, on one or more GAM1555 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21649] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1555 correlate with, and may be deduced from, the identity of the target genes which GAM1555 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21650] Nucleotide sequences of the GAM1555 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1555 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1555 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1555 are further described hereinbelow with reference to Table 1.

[21651] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1555 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21652] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1556 (GAM1556) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21653] GAM1556 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1556 was detected is described hereinabove with reference to Figs. 2-8.

[21654] GAM1556 gene, herein designated GAM GENE, and GAM1556 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21655] GAM1556 gene, herein designated GAM GENE, encodes a GAM1556 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1556 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1556 precursor RNA is designated SEQ ID:1533, and is provided hereinbelow with reference to the sequence listing part.

[21656] GAM1556 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21657] An enzyme complex designated DICER COMPLEX, dices the GAM1556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1556 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1556 RNA is designated SEQ ID:4138, and is provided hereinbelow with reference to the sequence listing part.

[21658] GAM1556 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1556 target RNA, herein designated GAM TARGET RNA. GAM1556 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21659] GAM1556 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1556 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1556 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1556 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1556 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21660] The complementary binding of GAM1556 RNA, herein designated GAM RNA, to target binding sites on GAM1556 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1556 target RNA, herein designated GAM TARGET RNA, into GAM1556 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21661] It is appreciated that GAM1556 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1556 target genes. The

mRNA of each one of this plurality of GAM1556 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1556 RNA, herein designated GAM RNA, and which when bound by GAM1556 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1556 target proteins.

[21662] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1556 gene, herein designated GAM GENE, on one or more GAM1556 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21663] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1556 correlate with, and may be deduced from, the identity of the target genes which GAM1556 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21664] Nucleotide sequences of the GAM1556 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1556 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1556 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1556 are further described hereinbelow with reference to Table 1.

[21665] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1556 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21666] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1557 (GAM1557) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21667] GAM1557 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1557 was detected is described hereinabove with reference to Figs. 2-8.

[21668] GAM1557 gene, herein designated GAM GENE, and GAM1557 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21669] GAM1557 gene, herein designated GAM GENE, encodes a GAM1557 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1557 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1557 precursor RNA is designated SEQ ID:1534, and is provided hereinbelow with reference to the sequence listing part.

[21670] GAM1557 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21671] An enzyme complex designated DICER COMPLEX, dices the GAM1557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1557 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1557 RNA is designated SEQ ID:4139, and is provided hereinbelow with reference to the sequence listing part.

[21672] GAM1557 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1557 target RNA, herein designated GAM TARGET RNA. GAM1557 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21673] GAM1557 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1557 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1557 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1557 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1557 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21674] The complementary binding of GAM1557 RNA, herein designated GAM RNA, to target binding sites on GAM1557 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1557 target RNA, herein designated GAM TARGET RNA, into GAM1557 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21675] It is appreciated that GAM1557 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1557 target genes. The mRNA of each one of this plurality of GAM1557 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1557 RNA, herein designated GAM RNA, and which when bound by GAM1557 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1557 target proteins.

[21676] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1557 gene, herein designated GAM GENE, on one or more GAM1557 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21677] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1557 correlate with, and may be deduced from, the identity of the target

genes which GAM1557 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21678] Nucleotide sequences of the GAM1557 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1557 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1557 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1557 are further described hereinbelow with reference to Table 1.

[21679] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1557 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21680] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1558 (GAM1558) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21681] GAM1558 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1558 was detected is described hereinabove with reference to Figs. 2-8.

[21682] GAM1558 gene, herein designated GAM GENE, and GAM1558 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[21683] GAM1558 gene, herein designated GAM GENE, encodes a GAM1558 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1558 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1558 precursor RNA is designated SEQ ID:1535, and is provided hereinbelow with reference to the sequence listing part.

[21684] GAM1558 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21685] An enzyme complex designated DICER COMPLEX, dices the GAM1558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1558 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1558 RNA is designated SEQ ID:4140, and is provided

hereinbelow with reference to the sequence listing part.

[21686] GAM1558 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1558 target RNA, herein designated GAM TARGET RNA. GAM1558 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21687] GAM1558 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1558 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1558 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1558 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1558 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21688] The complementary binding of GAM1558 RNA, herein designated GAM RNA, to target binding sites on GAM1558 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1558 target RNA, herein designated GAM TARGET RNA, into GAM1558 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21689] It is appreciated that GAM1558 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1558 target genes. The mRNA of each one of this plurality of GAM1558 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1558 RNA, herein designated GAM RNA, and which when bound by GAM1558 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1558 target proteins.

[21690] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1558 gene, herein designated GAM GENE, on one or more GAM1558 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21691] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1558 correlate with, and may be deduced from, the identity of the target genes which GAM1558 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21692] Nucleotide sequences of the GAM1558 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1558 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1558 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1558 are further described hereinbelow with reference to Table 1.

[21693] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1558 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21694] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1559 (GAM1559) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21695] GAM1559 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1559 was detected is described hereinabove with reference to Figs. 2-8.

[21696] GAM1559 gene, herein designated GAM GENE, and GAM1559 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21697] GAM1559 gene, herein designated GAM GENE, encodes a GAM1559 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1559 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1559 precursor RNA is designated SEQ ID:1536, and is provided hereinbelow with reference to the sequence listing part.

[21698] GAM1559 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21699] An enzyme complex designated DICER COMPLEX, dices the GAM1559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1559 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM1559 RNA is designated SEQ ID:4141, and is provided hereinbelow with reference to the sequence listing part.

[21700] GAM1559 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1559 target RNA, herein designated GAM TARGET RNA. GAM1559 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21701] GAM1559 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1559 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1559 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1559 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1559 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21702] The complementary binding of GAM1559 RNA, herein designated GAM RNA, to target binding sites on GAM1559 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1559 target RNA, herein designated GAM TARGET RNA, into GAM1559 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21703] It is appreciated that GAM1559 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1559 target genes. The mRNA of each one of this plurality of GAM1559 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1559 RNA, herein designated GAM RNA, and which when bound by GAM1559 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1559 target proteins.

[21704] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1559 gene, herein designated GAM GENE, on one or more GAM1559 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21705] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1559 correlate with, and may be deduced from, the identity of the target genes which GAM1559 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21706] Nucleotide sequences of the GAM1559 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1559 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1559 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1559 are further described hereinbelow with reference to Table 1.

[21707] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1559 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21708] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1560 (GAM1560) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21709] GAM1560 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1560 was detected is described hereinabove with reference to Figs. 2-8.

[21710] GAM1560 gene, herein designated GAM GENE, and GAM1560 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21711] GAM1560 gene, herein designated GAM GENE, encodes a GAM1560 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1560 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1560 precursor RNA is designated SEQ ID:1537, and is provided hereinbelow with reference to the sequence listing part.

[21712] GAM1560 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1560 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21713] An enzyme complex designated DICER COMPLEX, dices the GAM1560 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1560 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1560 RNA is designated SEQ ID:4142, and is provided hereinbelow with reference to the sequence listing part.

[21714] GAM1560 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1560 target RNA, herein designated GAM TARGET RNA. GAM1560 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21715] GAM1560 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1560 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1560 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1560 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1560 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21716] The complementary binding of GAM1560 RNA, herein designated GAM RNA, to target binding sites on GAM1560 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1560 target RNA, herein designated GAM TARGET RNA, into GAM1560 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21717] It is appreciated that GAM1560 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1560 target genes. The mRNA of each one of this plurality of GAM1560 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1560 RNA, herein designated GAM RNA, and which when bound by GAM1560 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1560 target proteins.

[21718] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1560 gene, herein designated GAM GENE, on one or more GAM1560 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21719] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1560 correlate with, and may be deduced from, the identity of the target genes which GAM1560 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21720] Nucleotide sequences of the GAM1560 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1560 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1560 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1560 are further described hereinbelow with reference to Table 1.

[21721] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1560 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[21722] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1561 (GAM1561) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21723] GAM1561 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1561 was detected is described hereinabove with reference to Figs. 2-8.

[21724] GAM1561 gene, herein designated GAM GENE, and GAM1561 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21725] GAM1561 gene, herein designated GAM GENE, encodes a GAM1561 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1561 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1561 precursor RNA is designated SEQ ID:1538, and is provided hereinbelow with reference to the sequence listing part.

[21726] GAM1561 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1561 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21727] An enzyme complex designated DICER COMPLEX, dices the GAM1561 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1561 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1561 RNA is designated SEQ ID:4143, and is provided hereinbelow with reference to the sequence listing part.

[21728] GAM1561 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1561 target RNA, herein designated GAM TARGET RNA. GAM1561 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21729] GAM1561 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1561 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1561 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1561 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1561 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21730] The complementary binding of GAM1561 RNA, herein designated GAM RNA, to target binding sites on GAM1561 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1561 target RNA, herein designated GAM TARGET RNA, into GAM1561 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21731] It is appreciated that GAM1561 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1561 target genes. The mRNA of each one of this plurality of GAM1561 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1561 RNA, herein designated GAM RNA, and which when bound by GAM1561 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1561 target proteins.

[21732] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1561 gene, herein designated GAM GENE, on one or more GAM1561 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21733] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1561 correlate with, and may be deduced from, the identity of the target genes which GAM1561 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21734] Nucleotide sequences of the GAM1561 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1561 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1561 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1561 are further described hereinbelow with reference to Table 1.

[21735] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1561 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21736] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1562 (GAM1562) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21737] GAM1562 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1562 was detected is described hereinabove with reference to Figs. 2-8.

[21738] GAM1562 gene, herein designated GAM GENE, and GAM1562 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21739] GAM1562 gene, herein designated GAM GENE, encodes a GAM1562 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1562 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1562 precursor RNA is designated SEQ ID:1539, and is provided hereinbelow with reference to the sequence listing part.

[21740] GAM1562 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1562 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21741] An enzyme complex designated DICER COMPLEX, dices the GAM1562 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1562 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1562 RNA is designated SEQ ID:4144, and is provided hereinbelow with reference to the sequence listing part.

[21742] GAM1562 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1562 target RNA, herein designated GAM TARGET RNA. GAM1562 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21743] GAM1562 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1562 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1562 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1562 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1562 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21744] The complementary binding of GAM1562 RNA, herein designated GAM RNA, to target binding sites on GAM1562 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1562 target RNA, herein designated GAM TARGET RNA, into GAM1562 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21745] It is appreciated that GAM1562 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1562 target genes. The

mRNA of each one of this plurality of GAM1562 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1562 RNA, herein designated GAM RNA, and which when bound by GAM1562 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1562 target proteins.

[21746] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1562 gene, herein designated GAM GENE, on one or more GAM1562 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21747] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1562 correlate with, and may be deduced from, the identity of the target genes which GAM1562 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21748] Nucleotide sequences of the GAM1562 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1562 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1562 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1562 are further described hereinbelow with reference to Table 1.

[21749] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1562 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21750] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1563 (GAM1563) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21751] GAM1563 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1563 was detected is described hereinabove with reference to Figs. 2-8.

[21752] GAM1563 gene, herein designated GAM GENE, and GAM1563 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21753] GAM1563 gene, herein designated GAM GENE, encodes a GAM1563 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1563 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1563 precursor RNA is designated SEQ ID:1540, and is provided hereinbelow with reference to the sequence listing part.

[21754] GAM1563 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21755] An enzyme complex designated DICER COMPLEX, dices the GAM1563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1563 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1563 RNA is designated SEQ ID:4145, and is provided hereinbelow with reference to the sequence listing part.

[21756] GAM1563 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1563 target RNA, herein designated GAM TARGET RNA. GAM1563 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21757] GAM1563 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1563 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1563 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1563 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1563 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21758] The complementary binding of GAM1563 RNA, herein designated GAM RNA, to target binding sites on GAM1563 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1563 target RNA, herein designated GAM TARGET RNA, into GAM1563 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21759] It is appreciated that GAM1563 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1563 target genes. The mRNA of each one of this plurality of GAM1563 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1563 RNA, herein designated GAM RNA, and which when bound by GAM1563 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1563 target proteins.

[21760] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1563 gene, herein designated GAM GENE, on one or more GAM1563 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21761] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1563 correlate with, and may be deduced from, the identity of the target

genes which GAM1563 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21762] Nucleotide sequences of the GAM1563 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1563 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1563 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1563 are further described hereinbelow with reference to Table 1.

[21763] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1563 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21764] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1564 (GAM1564) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21765] GAM1564 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1564 was detected is described hereinabove with reference to Figs. 2-8.

[21766] GAM1564 gene, herein designated GAM GENE, and GAM1564 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[21767] GAM1564 gene, herein designated GAM GENE, encodes a GAM1564 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1564 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1564 precursor RNA is designated SEQ ID:1541, and is provided hereinbelow with reference to the sequence listing part.

[21768] GAM1564 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21769] An enzyme complex designated DICER COMPLEX, dices the GAM1564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1564 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1564 RNA is designated SEQ ID:4146, and is provided

hereinbelow with reference to the sequence listing part.

[21770] GAM1564 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1564 target RNA, herein designated GAM TARGET RNA. GAM1564 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21771] GAM1564 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1564 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1564 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1564 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1564 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21772] The complementary binding of GAM1564 RNA, herein designated GAM RNA, to target binding sites on GAM1564 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1564 target RNA, herein designated GAM TARGET RNA, into GAM1564 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21773] It is appreciated that GAM1564 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1564 target genes. The mRNA of each one of this plurality of GAM1564 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1564 RNA, herein designated GAM RNA, and which when bound by GAM1564 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1564 target proteins.

[21774] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1564 gene, herein designated GAM GENE, on one or more GAM1564 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21775] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1564 correlate with, and may be deduced from, the identity of the target genes which GAM1564 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21776] Nucleotide sequences of the GAM1564 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1564 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1564 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1564 are further described hereinbelow with reference to Table 1.

[21777] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1564 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21778] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1565 (GAM1565) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21779] GAM1565 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1565 was detected is described hereinabove with reference to Figs. 2-8.

[21780] GAM1565 gene, herein designated GAM GENE, and GAM1565 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21781] GAM1565 gene, herein designated GAM GENE, encodes a GAM1565 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1565 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1565 precursor RNA is designated SEQ ID:1542, and is provided hereinbelow with reference to the sequence listing part.

[21782] GAM1565 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21783] An enzyme complex designated DICER COMPLEX, dices the GAM1565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1565 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1565 RNA is designated SEQ ID:4147, and is provided hereinbelow with reference to the sequence listing part.

[21784] GAM1565 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1565 target RNA, herein designated GAM TARGET RNA. GAM1565 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21785] GAM1565 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1565 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1565 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1565 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1565 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21786] The complementary binding of GAM1565 RNA, herein designated GAM RNA, to target binding sites on GAM1565 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1565 target RNA, herein designated GAM TARGET RNA, into GAM1565 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21787] It is appreciated that GAM1565 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1565 target genes. The mRNA of each one of this plurality of GAM1565 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1565 RNA, herein designated GAM RNA, and which when bound by GAM1565 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1565 target proteins.

[21788] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1565 gene, herein designated GAM GENE, on one or more GAM1565 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21789] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1565 correlate with, and may be deduced from, the identity of the target genes which GAM1565 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21790] Nucleotide sequences of the GAM1565 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1565 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1565 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1565 are further described hereinbelow with reference to Table 1.

[21791] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1565 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21792] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1566 (GAM1566) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21793] GAM1566 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1566 was detected is described hereinabove with reference to Figs. 2-8.

[21794] GAM1566 gene, herein designated GAM GENE, and GAM1566 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21795] GAM1566 gene, herein designated GAM GENE, encodes a GAM1566 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1566 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1566 precursor RNA is designated SEQ ID:1543, and is provided hereinbelow with reference to the sequence listing part.

[21796] GAM1566 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1566 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21797] An enzyme complex designated DICER COMPLEX, dices the GAM1566 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1566 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1566 RNA is designated SEQ ID:4148, and is provided hereinbelow with reference to the sequence listing part.

[21798] GAM1566 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1566 target RNA, herein designated GAM TARGET RNA. GAM1566 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21799] GAM1566 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1566 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1566 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1566 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1566 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21800] The complementary binding of GAM1566 RNA, herein designated GAM RNA, to target binding sites on GAM1566 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1566 target RNA, herein designated GAM TARGET RNA, into GAM1566 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21801] It is appreciated that GAM1566 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1566 target genes. The mRNA of each one of this plurality of GAM1566 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1566 RNA, herein designated GAM RNA, and which when bound by GAM1566 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1566 target proteins.

[21802] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1566 gene, herein designated GAM GENE, on one or more GAM1566 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21803] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1566 correlate with, and may be deduced from, the identity of the target genes which GAM1566 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21804] Nucleotide sequences of the GAM1566 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1566 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1566 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1566 are further described hereinbelow with reference to Table 1.

[21805] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1566 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[21806] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1567 (GAM1567) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21807] GAM1567 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1567 was detected is described hereinabove with reference to Figs. 2-8.

[21808] GAM1567 gene, herein designated GAM GENE, and GAM1567 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21809] GAM1567 gene, herein designated GAM GENE, encodes a GAM1567 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1567 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1567 precursor RNA is designated SEQ ID:1544, and is provided hereinbelow with reference to the sequence listing part.

[21810] GAM1567 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21811] An enzyme complex designated DICER COMPLEX, dices the GAM1567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1567 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1567 RNA is designated SEQ ID:4150, and is provided hereinbelow with reference to the sequence listing part.

[21812] GAM1567 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1567 target RNA, herein designated GAM TARGET RNA. GAM1567 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21813] GAM1567 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1567 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1567 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1567 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1567 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21814] The complementary binding of GAM1567 RNA, herein designated GAM RNA, to target binding sites on GAM1567 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1567 target RNA, herein designated GAM TARGET RNA, into GAM1567 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21815] It is appreciated that GAM1567 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1567 target genes. The mRNA of each one of this plurality of GAM1567 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1567 RNA, herein designated GAM RNA, and which when bound by GAM1567 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1567 target proteins.

[21816] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1567 gene, herein designated GAM GENE, on one or more GAM1567 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21817] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1567 correlate with, and may be deduced from, the identity of the target genes which GAM1567 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21818] Nucleotide sequences of the GAM1567 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1567 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1567 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1567 are further described hereinbelow with reference to Table 1.

[21819] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1567 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21820] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1568 (GAM1568) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21821] GAM1568 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1568 was detected is described hereinabove with reference to Figs. 2-8.

[21822] GAM1568 gene, herein designated GAM GENE, and GAM1568 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21823] GAM1568 gene, herein designated GAM GENE, encodes a GAM1568 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1568 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1568 precursor RNA is designated SEQ ID:1545, and is provided hereinbelow with reference to the sequence listing part.

[21824] GAM1568 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1568 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21825] An enzyme complex designated DICER COMPLEX, dices the GAM1568 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1568 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1568 RNA is designated SEQ ID:4149, and is provided hereinbelow with reference to the sequence listing part.

[21826] GAM1568 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1568 target RNA, herein designated GAM TARGET RNA. GAM1568 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21827] GAM1568 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1568 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1568 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1568 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1568 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21828] The complementary binding of GAM1568 RNA, herein designated GAM RNA, to target binding sites on GAM1568 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1568 target RNA, herein designated GAM TARGET RNA, into GAM1568 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21829] It is appreciated that GAM1568 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1568 target genes. The

mRNA of each one of this plurality of GAM1568 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1568 RNA, herein designated GAM RNA, and which when bound by GAM1568 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1568 target proteins.

[21830] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1568 gene, herein designated GAM GENE, on one or more GAM1568 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21831] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1568 correlate with, and may be deduced from, the identity of the target genes which GAM1568 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21832] Nucleotide sequences of the GAM1568 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1568 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1568 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1568 are further described hereinbelow with reference to Table 1.

[21833] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1568 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21834] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1569 (GAM1569) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21835] GAM1569 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1569 was detected is described hereinabove with reference to Figs. 2-8.

[21836] GAM1569 gene, herein designated GAM GENE, and GAM1569 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21837] GAM1569 gene, herein designated GAM GENE, encodes a GAM1569 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1569 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1569 precursor RNA is designated SEQ ID:1546, and is provided hereinbelow with reference to the sequence listing part.

[21838] GAM1569 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21839] An enzyme complex designated DICER COMPLEX, dices the GAM1569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1569 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1569 RNA is designated SEQ ID:4152, and is provided hereinbelow with reference to the sequence listing part.

[21840] GAM1569 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1569 target RNA, herein designated GAM TARGET RNA. GAM1569 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21841] GAM1569 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1569 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1569 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1569 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1569 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21842] The complementary binding of GAM1569 RNA, herein designated GAM RNA, to target binding sites on GAM1569 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1569 target RNA, herein designated GAM TARGET RNA, into GAM1569 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21843] It is appreciated that GAM1569 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1569 target genes. The mRNA of each one of this plurality of GAM1569 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1569 RNA, herein designated GAM RNA, and which when bound by GAM1569 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1569 target proteins.

[21844] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1569 gene, herein designated GAM GENE, on one or more GAM1569 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21845] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1569 correlate with, and may be deduced from, the identity of the target

genes which GAM1569 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21846] Nucleotide sequences of the GAM1569 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1569 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1569 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1569 are further described hereinbelow with reference to Table 1.

[21847] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1569 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21848] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1570 (GAM1570) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21849] GAM1570 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1570 was detected is described hereinabove with reference to Figs. 2-8.

[21850] GAM1570 gene, herein designated GAM GENE, and GAM1570 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[21851] GAM1570 gene, herein designated GAM GENE, encodes a GAM1570 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1570 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1570 precursor RNA is designated SEQ ID:1547, and is provided hereinbelow with reference to the sequence listing part.

[21852] GAM1570 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21853] An enzyme complex designated DICER COMPLEX, dices the GAM1570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1570 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1570 RNA is designated SEQ ID:4151, and is provided

hereinbelow with reference to the sequence listing part.

[21854] GAM1570 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1570 target RNA, herein designated GAM TARGET RNA. GAM1570 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21855] GAM1570 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1570 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1570 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1570 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1570 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21856] The complementary binding of GAM1570 RNA, herein designated GAM RNA, to target binding sites on GAM1570 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1570 target RNA, herein designated GAM TARGET RNA, into GAM1570 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21857] It is appreciated that GAM1570 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1570 target genes. The mRNA of each one of this plurality of GAM1570 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1570 RNA, herein designated GAM RNA, and which when bound by GAM1570 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1570 target proteins.

[21858] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1570 gene, herein designated GAM GENE, on one or more GAM1570 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21859] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1570 correlate with, and may be deduced from, the identity of the target genes which GAM1570 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21860] Nucleotide sequences of the GAM1570 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1570 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1570 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1570 are further described hereinbelow with reference to Table 1.

[21861] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1570 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21862] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1571 (GAM1571) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21863] GAM1571 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1571 was detected is described hereinabove with reference to Figs. 2-8.

[21864] GAM1571 gene, herein designated GAM GENE, and GAM1571 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21865] GAM1571 gene, herein designated GAM GENE, encodes a GAM1571 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1571 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1571 precursor RNA is designated SEQ ID:1548, and is provided hereinbelow with reference to the sequence listing part.

[21866] GAM1571 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21867] An enzyme complex designated DICER COMPLEX, dices the GAM1571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1571 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1571 RNA is designated SEQ ID:4153, and is provided hereinbelow with reference to the sequence listing part.

[21868] GAM1571 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1571 target RNA, herein designated GAM TARGET RNA. GAM1571 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21869] GAM1571 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1571 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1571 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1571 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1571 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21870] The complementary binding of GAM1571 RNA, herein designated GAM RNA, to target binding sites on GAM1571 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1571 target RNA, herein designated GAM TARGET RNA, into GAM1571 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21871] It is appreciated that GAM1571 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1571 target genes. The mRNA of each one of this plurality of GAM1571 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1571 RNA, herein designated GAM RNA, and which when bound by GAM1571 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1571 target proteins.

[21872] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1571 gene, herein designated GAM GENE, on one or more GAM1571 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21873] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1571 correlate with, and may be deduced from, the identity of the target genes which GAM1571 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21874] Nucleotide sequences of the GAM1571 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1571 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1571 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1571 are further described hereinbelow with reference to Table 1.

[21875] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1571 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21876] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1572 (GAM1572) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21877] GAM1572 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1572 was detected is described hereinabove with reference to Figs. 2-8.

[21878] GAM1572 gene, herein designated GAM GENE, and GAM1572 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21879] GAM1572 gene, herein designated GAM GENE, encodes a GAM1572 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1572 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1572 precursor RNA is designated SEQ ID:1549, and is provided hereinbelow with reference to the sequence listing part.

[21880] GAM1572 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21881] An enzyme complex designated DICER COMPLEX, dices the GAM1572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1572 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1572 RNA is designated SEQ ID:4154, and is provided hereinbelow with reference to the sequence listing part.

[21882] GAM1572 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1572 target RNA, herein designated GAM TARGET RNA. GAM1572 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21883] GAM1572 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1572 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1572 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1572 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1572 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21884] The complementary binding of GAM1572 RNA, herein designated GAM RNA, to target binding sites on GAM1572 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1572 target RNA, herein designated GAM TARGET RNA, into GAM1572 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21885] It is appreciated that GAM1572 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1572 target genes. The mRNA of each one of this plurality of GAM1572 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1572 RNA, herein designated GAM RNA, and which when bound by GAM1572 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1572 target proteins.

[21886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1572 gene, herein designated GAM GENE, on one or more GAM1572 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21887] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1572 correlate with, and may be deduced from, the identity of the target genes which GAM1572 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21888] Nucleotide sequences of the GAM1572 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1572 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1572 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1572 are further described hereinbelow with reference to Table 1.

[21889] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1572 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[21890] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1573 (GAM1573) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21891] GAM1573 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1573 was detected is described hereinabove with reference to Figs. 2-8.

[21892] GAM1573 gene, herein designated GAM GENE, and GAM1573 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21893] GAM1573 gene, herein designated GAM GENE, encodes a GAM1573 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1573 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1573 precursor RNA is designated SEQ ID:1550, and is provided hereinbelow with reference to the sequence listing part.

[21894] GAM1573 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21895] An enzyme complex designated DICER COMPLEX, dices the GAM1573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1573 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1573 RNA is designated SEQ ID:4156, and is provided hereinbelow with reference to the sequence listing part.

[21896] GAM1573 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1573 target RNA, herein designated GAM TARGET RNA. GAM1573 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21897] GAM1573 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1573 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1573 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1573 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1573 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21898] The complementary binding of GAM1573 RNA, herein designated GAM RNA, to target binding sites on GAM1573 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1573 target RNA, herein designated GAM TARGET RNA, into GAM1573 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21899] It is appreciated that GAM1573 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1573 target genes. The mRNA of each one of this plurality of GAM1573 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1573 RNA, herein designated GAM RNA, and which when bound by GAM1573 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1573 target proteins.

[21900] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1573 gene, herein designated GAM GENE, on one or more GAM1573 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21901] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1573 correlate with, and may be deduced from, the identity of the target genes which GAM1573 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21902] Nucleotide sequences of the GAM1573 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1573 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1573 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1573 are further described hereinbelow with reference to Table 1.

[21903] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1573 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21904] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1574 (GAM1574) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21905] GAM1574 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1574 was detected is described hereinabove with reference to Figs. 2-8.

[21906] GAM1574 gene, herein designated GAM GENE, and GAM1574 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21907] GAM1574 gene, herein designated GAM GENE, encodes a GAM1574 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1574 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1574 precursor RNA is designated SEQ ID:1551, and is provided hereinbelow with reference to the sequence listing part.

[21908] GAM1574 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21909] An enzyme complex designated DICER COMPLEX, dices the GAM1574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1574 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1574 RNA is designated SEQ ID:4155, and is provided hereinbelow with reference to the sequence listing part.

[21910] GAM1574 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1574 target RNA, herein designated GAM TARGET RNA. GAM1574 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21911] GAM1574 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1574 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1574 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1574 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1574 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21912] The complementary binding of GAM1574 RNA, herein designated GAM RNA, to target binding sites on GAM1574 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1574 target RNA, herein designated GAM TARGET RNA, into GAM1574 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21913] It is appreciated that GAM1574 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1574 target genes. The

mRNA of each one of this plurality of GAM1574 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1574 RNA, herein designated GAM RNA, and which when bound by GAM1574 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1574 target proteins.

[21914] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1574 gene, herein designated GAM GENE, on one or more GAM1574 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21915] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1574 correlate with, and may be deduced from, the identity of the target genes which GAM1574 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21916] Nucleotide sequences of the GAM1574 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1574 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1574 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1574 are further described hereinbelow with reference to Table 1.

[21917] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1574 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21918] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1575 (GAM1575) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21919] GAM1575 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1575 was detected is described hereinabove with reference to Figs. 2-8.

[21920] GAM1575 gene, herein designated GAM GENE, and GAM1575 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21921] GAM1575 gene, herein designated GAM GENE, encodes a GAM1575 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1575 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1575 precursor RNA is designated SEQ ID:1552, and is provided hereinbelow with reference to the sequence listing part.

[21922] GAM1575 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21923] An enzyme complex designated DICER COMPLEX, dices the GAM1575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1575 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1575 RNA is designated SEQ ID:4157, and is provided hereinbelow with reference to the sequence listing part.

[21924] GAM1575 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1575 target RNA, herein designated GAM TARGET RNA. GAM1575 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21925] GAM1575 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1575 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1575 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1575 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1575 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21926] The complementary binding of GAM1575 RNA, herein designated GAM RNA, to target binding sites on GAM1575 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1575 target RNA, herein designated GAM TARGET RNA, into GAM1575 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21927] It is appreciated that GAM1575 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1575 target genes. The mRNA of each one of this plurality of GAM1575 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1575 RNA, herein designated GAM RNA, and which when bound by GAM1575 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1575 target proteins.

[21928] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1575 gene, herein designated GAM GENE, on one or more GAM1575 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21929] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1575 correlate with, and may be deduced from, the identity of the target

genes which GAM1575 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21930] Nucleotide sequences of the GAM1575 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1575 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1575 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1575 are further described hereinbelow with reference to Table 1.

[21931] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1575 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21932] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1576 (GAM1576) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21933] GAM1576 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1576 was detected is described hereinabove with reference to Figs. 2-8.

[21934] GAM1576 gene, herein designated GAM GENE, and GAM1576 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[21935] GAM1576 gene, herein designated GAM GENE, encodes a GAM1576 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1576 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1576 precursor RNA is designated SEQ ID:1553, and is provided hereinbelow with reference to the sequence listing part.

[21936] GAM1576 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1576 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21937] An enzyme complex designated DICER COMPLEX, dices the GAM1576 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1576 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1576 RNA is designated SEQ ID:4159, and is provided

hereinbelow with reference to the sequence listing part.

[21938] GAM1576 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1576 target RNA, herein designated GAM TARGET RNA. GAM1576 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21939] GAM1576 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1576 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1576 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1576 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1576 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21940] The complementary binding of GAM1576 RNA, herein designated GAM RNA, to target binding sites on GAM1576 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1576 target RNA, herein designated GAM TARGET RNA, into GAM1576 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21941] It is appreciated that GAM1576 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1576 target genes. The mRNA of each one of this plurality of GAM1576 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1576 RNA, herein designated GAM RNA, and which when bound by GAM1576 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1576 target proteins.

[21942] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1576 gene, herein designated GAM GENE, on one or more GAM1576 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21943] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1576 correlate with, and may be deduced from, the identity of the target genes which GAM1576 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21944] Nucleotide sequences of the GAM1576 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1576 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1576 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1576 are further described hereinbelow with reference to Table 1.

[21945] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1576 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21946] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1577 (GAM1577) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21947] GAM1577 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1577 was detected is described hereinabove with reference to Figs. 2-8.

[21948] GAM1577 gene, herein designated GAM GENE, and GAM1577 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21949] GAM1577 gene, herein designated GAM GENE, encodes a GAM1577 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1577 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1577 precursor RNA is designated SEQ ID:1554, and is provided hereinbelow with reference to the sequence listing part.

[21950] GAM1577 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1577 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21951] An enzyme complex designated DICER COMPLEX, dices the GAM1577 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1577 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1577 RNA is designated SEQ ID:4158, and is provided hereinbelow with reference to the sequence listing part.

[21952] GAM1577 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1577 target RNA, herein designated GAM TARGET RNA. GAM1577 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21953] GAM1577 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1577 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1577 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1577 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1577 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21954] The complementary binding of GAM1577 RNA, herein designated GAM RNA, to target binding sites on GAM1577 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1577 target RNA, herein designated GAM TARGET RNA, into GAM1577 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21955] It is appreciated that GAM1577 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1577 target genes. The mRNA of each one of this plurality of GAM1577 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1577 RNA, herein designated GAM RNA, and which when bound by GAM1577 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1577 target proteins.

[21956] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1577 gene, herein designated GAM GENE, on one or more GAM1577 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21957] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1577 correlate with, and may be deduced from, the identity of the target genes which GAM1577 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21958] Nucleotide sequences of the GAM1577 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1577 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1577 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1577 are further described hereinbelow with reference to Table 1.

[21959] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1577 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21960] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1578 (GAM1578) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21961] GAM1578 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1578 was detected is described hereinabove with reference to Figs. 2-8.

[21962] GAM1578 gene, herein designated GAM GENE, and GAM1578 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21963] GAM1578 gene, herein designated GAM GENE, encodes a GAM1578 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1578 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1578 precursor RNA is designated SEQ ID:1555, and is provided hereinbelow with reference to the sequence listing part.

[21964] GAM1578 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21965] An enzyme complex designated DICER COMPLEX, dices the GAM1578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1578 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1578 RNA is designated SEQ ID:4160, and is provided hereinbelow with reference to the sequence listing part.

[21966] GAM1578 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1578 target RNA, herein designated GAM TARGET RNA. GAM1578 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21967] GAM1578 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1578 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1578 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1578 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1578 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21968] The complementary binding of GAM1578 RNA, herein designated GAM RNA, to target binding sites on GAM1578 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1578 target RNA, herein designated GAM TARGET RNA, into GAM1578 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21969] It is appreciated that GAM1578 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1578 target genes. The mRNA of each one of this plurality of GAM1578 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1578 RNA, herein designated GAM RNA, and which when bound by GAM1578 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1578 target proteins.

[21970] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1578 gene, herein designated GAM GENE, on one or more GAM1578 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21971] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1578 correlate with, and may be deduced from, the identity of the target genes which GAM1578 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21972] Nucleotide sequences of the GAM1578 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1578 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1578 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1578 are further described hereinbelow with reference to Table 1.

[21973] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1578 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[21974] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1579 (GAM1579) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21975] GAM1579 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1579 was detected is described hereinabove with reference to Figs. 2-8.

[21976] GAM1579 gene, herein designated GAM GENE, and GAM1579 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21977] GAM1579 gene, herein designated GAM GENE, encodes a GAM1579 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1579 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1579 precursor RNA is designated SEQ ID:1556, and is provided hereinbelow with reference to the sequence listing part.

[21978] GAM1579 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21979] An enzyme complex designated DICER COMPLEX, dices the GAM1579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1579 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1579 RNA is designated SEQ ID:4161, and is provided hereinbelow with reference to the sequence listing part.

[21980] GAM1579 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1579 target RNA, herein designated GAM TARGET RNA. GAM1579 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21981] GAM1579 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1579 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1579 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1579 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1579 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21982] The complementary binding of GAM1579 RNA, herein designated GAM RNA, to target binding sites on GAM1579 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1579 target RNA, herein designated GAM TARGET RNA, into GAM1579 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21983] It is appreciated that GAM1579 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1579 target genes. The mRNA of each one of this plurality of GAM1579 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1579 RNA, herein designated GAM RNA, and which when bound by GAM1579 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1579 target proteins.

[21984] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1579 gene, herein designated GAM GENE, on one or more GAM1579 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21985] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1579 correlate with, and may be deduced from, the identity of the target genes which GAM1579 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21986] Nucleotide sequences of the GAM1579 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1579 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1579 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1579 are further described hereinbelow with reference to Table 1.

[21987] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1579 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21988] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1580 (GAM1580) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21989] GAM1580 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1580 was detected is described hereinabove with reference to Figs. 2-8.

[21990] GAM1580 gene, herein designated GAM GENE, and GAM1580 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21991] GAM1580 gene, herein designated GAM GENE, encodes a GAM1580 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1580 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1580 precursor RNA is designated SEQ ID:1557, and is provided hereinbelow with reference to the sequence listing part.

[21992] GAM1580 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21993] An enzyme complex designated DICER COMPLEX, dices the GAM1580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1580 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1580 RNA is designated SEQ ID:4162, and is provided hereinbelow with reference to the sequence listing part.

[21994] GAM1580 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1580 target RNA, herein designated GAM TARGET RNA. GAM1580 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21995] GAM1580 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1580 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1580 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1580 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1580 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21996] The complementary binding of GAM1580 RNA, herein designated GAM RNA, to target binding sites on GAM1580 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1580 target RNA, herein designated GAM TARGET RNA, into GAM1580 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21997] It is appreciated that GAM1580 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1580 target genes. The

mRNA of each one of this plurality of GAM1580 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1580 RNA, herein designated GAM RNA, and which when bound by GAM1580 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1580 target proteins.

[21998] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1580 gene, herein designated GAM GENE, on one or more GAM1580 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21999] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1580 correlate with, and may be deduced from, the identity of the target genes which GAM1580 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22000] Nucleotide sequences of the GAM1580 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1580 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1580 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1580 are further described hereinbelow with reference to Table 1.

[22001] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1580 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22002] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1581 (GAM1581) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22003] GAM1581 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1581 was detected is described hereinabove with reference to Figs. 2-8.

[22004] GAM1581 gene, herein designated GAM GENE, and GAM1581 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22005] GAM1581 gene, herein designated GAM GENE, encodes a GAM1581 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1581 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1581 precursor RNA is designated SEQ ID:1558, and is provided hereinbelow with reference to the sequence listing part.

[22006] GAM1581 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1581 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22007] An enzyme complex designated DICER COMPLEX, dices the GAM1581 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1581 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1581 RNA is designated SEQ ID:4163, and is provided hereinbelow with reference to the sequence listing part.

[22008] GAM1581 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1581 target RNA, herein designated GAM TARGET RNA. GAM1581 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22009] GAM1581 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1581 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1581 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1581 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1581 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22010] The complementary binding of GAM1581 RNA, herein designated GAM RNA, to target binding sites on GAM1581 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1581 target RNA, herein designated GAM TARGET RNA, into GAM1581 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22011] It is appreciated that GAM1581 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1581 target genes. The mRNA of each one of this plurality of GAM1581 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1581 RNA, herein designated GAM RNA, and which when bound by GAM1581 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1581 target proteins.

[22012] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1581 gene, herein designated GAM GENE, on one or more GAM1581 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22013] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1581 correlate with, and may be deduced from, the identity of the target

genes which GAM1581 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22014] Nucleotide sequences of the GAM1581 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1581 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1581 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1581 are further described hereinbelow with reference to Table 1.

[22015] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1581 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22016] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1582 (GAM1582) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22017] GAM1582 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1582 was detected is described hereinabove with reference to Figs. 2-8.

[22018] GAM1582 gene, herein designated GAM GENE, and GAM1582 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[22019] GAM1582 gene, herein designated GAM GENE, encodes a GAM1582 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1582 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1582 precursor RNA is designated SEQ ID:1559, and is provided hereinbelow with reference to the sequence listing part.

[22020] GAM1582 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1582 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22021] An enzyme complex designated DICER COMPLEX, dices the GAM1582 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1582 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1582 RNA is designated SEQ ID:4164, and is provided

hereinbelow with reference to the sequence listing part.

[22022] GAM1582 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1582 target RNA, herein designated GAM TARGET RNA. GAM1582 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22023] GAM1582 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1582 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1582 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1582 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1582 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22024] The complementary binding of GAM1582 RNA, herein designated GAM RNA, to target binding sites on GAM1582 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1582 target RNA, herein designated GAM TARGET RNA, into GAM1582 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22025] It is appreciated that GAM1582 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1582 target genes. The mRNA of each one of this plurality of GAM1582 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1582 RNA, herein designated GAM RNA, and which when bound by GAM1582 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1582 target proteins.

[22026] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1582 gene, herein designated GAM GENE, on one or more GAM1582 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22027] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1582 correlate with, and may be deduced from, the identity of the target genes which GAM1582 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22028] Nucleotide sequences of the GAM1582 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1582 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1582 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1582 are further described hereinbelow with reference to Table 1.

[22029] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1582 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22030] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1583 (GAM1583) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22031] GAM1583 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1583 was detected is described hereinabove with reference to Figs. 2-8.

[22032] GAM1583 gene, herein designated GAM GENE, and GAM1583 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22033] GAM1583 gene, herein designated GAM GENE, encodes a GAM1583 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1583 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1583 precursor RNA is designated SEQ ID:1560, and is provided hereinbelow with reference to the sequence listing part.

[22034] GAM1583 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1583 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22035] An enzyme complex designated DICER COMPLEX, dices the GAM1583 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1583 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM1583 RNA is designated SEQ ID:4166, and is provided hereinbelow with reference to the sequence listing part.

[22036] GAM1583 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1583 target RNA, herein designated GAM TARGET RNA. GAM1583 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22037] GAM1583 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1583 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1583 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1583 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1583 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22038] The complementary binding of GAM1583 RNA, herein designated GAM RNA, to target binding sites on GAM1583 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1583 target RNA, herein designated GAM TARGET RNA, into GAM1583 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22039] It is appreciated that GAM1583 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1583 target genes. The mRNA of each one of this plurality of GAM1583 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1583 RNA, herein designated GAM RNA, and which when bound by GAM1583 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1583 target proteins.

[22040] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1583 gene, herein designated GAM GENE, on one or more GAM1583 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22041] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1583 correlate with, and may be deduced from, the identity of the target genes which GAM1583 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22042] Nucleotide sequences of the GAM1583 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1583 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1583 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1583 are further described hereinbelow with reference to Table 1.

[22043] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1583 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22044] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1584 (GAM1584) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22045] GAM1584 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1584 was detected is described hereinabove with reference to Figs. 2-8.

[22046] GAM1584 gene, herein designated GAM GENE, and GAM1584 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22047] GAM1584 gene, herein designated GAM GENE, encodes a GAM1584 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1584 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1584 precursor RNA is designated SEQ ID:1561, and is provided hereinbelow with reference to the sequence listing part.

[22048] GAM1584 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22049] An enzyme complex designated DICER COMPLEX, dices the GAM1584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1584 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1584 RNA is designated SEQ ID:4165, and is provided hereinbelow with reference to the sequence listing part.

[22050] GAM1584 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1584 target RNA, herein designated GAM TARGET RNA. GAM1584 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22051] GAM1584 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1584 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1584 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1584 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1584 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22052] The complementary binding of GAM1584 RNA, herein designated GAM RNA, to target binding sites on GAM1584 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1584 target RNA, herein designated GAM TARGET RNA, into GAM1584 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22053] It is appreciated that GAM1584 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1584 target genes. The mRNA of each one of this plurality of GAM1584 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1584 RNA, herein designated GAM RNA, and which when bound by GAM1584 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1584 target proteins.

[22054] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1584 gene, herein designated GAM GENE, on one or more GAM1584 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22055] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1584 correlate with, and may be deduced from, the identity of the target genes which GAM1584 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22056] Nucleotide sequences of the GAM1584 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1584 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1584 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1584 are further described hereinbelow with reference to Table 1.

[22057] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1584 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[22058] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1585 (GAM1585) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22059] GAM1585 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1585 was detected is described hereinabove with reference to Figs. 2-8.

[22060] GAM1585 gene, herein designated GAM GENE, and GAM1585 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22061] GAM1585 gene, herein designated GAM GENE, encodes a GAM1585 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1585 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1585 precursor RNA is designated SEQ ID:1562, and is provided hereinbelow with reference to the sequence listing part.

[22062] GAM1585 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1585 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22063] An enzyme complex designated DICER COMPLEX, dices the GAM1585 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1585 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1585 RNA is designated SEQ ID:4167, and is provided hereinbelow with reference to the sequence listing part.

[22064] GAM1585 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1585 target RNA, herein designated GAM TARGET RNA. GAM1585 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22065] GAM1585 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1585 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1585 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1585 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1585 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22066] The complementary binding of GAM1585 RNA, herein designated GAM RNA, to target binding sites on GAM1585 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1585 target RNA, herein designated GAM TARGET RNA, into GAM1585 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22067] It is appreciated that GAM1585 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1585 target genes. The mRNA of each one of this plurality of GAM1585 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1585 RNA, herein designated GAM RNA, and which when bound by GAM1585 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1585 target proteins.

[22068] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1585 gene, herein designated GAM GENE, on one or more GAM1585 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22069] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1585 correlate with, and may be deduced from, the identity of the target genes which GAM1585 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22070] Nucleotide sequences of the GAM1585 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1585 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1585 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1585 are further described hereinbelow with reference to Table 1.

[22071] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1585 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22072] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1586 (GAM1586) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22073] GAM1586 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1586 was detected is described hereinabove with reference to Figs. 2-8.

[22074] GAM1586 gene, herein designated GAM GENE, and GAM1586 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22075] GAM1586 gene, herein designated GAM GENE, encodes a GAM1586 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1586 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1586 precursor RNA is designated SEQ ID:1563, and is provided hereinbelow with reference to the sequence listing part.

[22076] GAM1586 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22077] An enzyme complex designated DICER COMPLEX, dices the GAM1586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1586 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1586 RNA is designated SEQ ID:4170, and is provided hereinbelow with reference to the sequence listing part.

[22078] GAM1586 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1586 target RNA, herein designated GAM TARGET RNA. GAM1586 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22079] GAM1586 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1586 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1586 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1586 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1586 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22080] The complementary binding of GAM1586 RNA, herein designated GAM RNA, to target binding sites on GAM1586 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1586 target RNA, herein designated GAM TARGET RNA, into GAM1586 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22081] It is appreciated that GAM1586 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1586 target genes. The

mRNA of each one of this plurality of GAM1586 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1586 RNA, herein designated GAM RNA, and which when bound by GAM1586 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1586 target proteins.

[22082] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1586 gene, herein designated GAM GENE, on one or more GAM1586 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22083] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1586 correlate with, and may be deduced from, the identity of the target genes which GAM1586 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22084] Nucleotide sequences of the GAM1586 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1586 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1586 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1586 are further described hereinbelow with reference to Table 1.

[22085] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1586 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22086] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1587 (GAM1587) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22087] GAM1587 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1587 was detected is described hereinabove with reference to Figs. 2-8.

[22088] GAM1587 gene, herein designated GAM GENE, and GAM1587 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22089] GAM1587 gene, herein designated GAM GENE, encodes a GAM1587 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1587 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1587 precursor RNA is designated SEQ ID:1564, and is provided hereinbelow with reference to the sequence listing part.

[22090] GAM1587 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22091] An enzyme complex designated DICER COMPLEX, dices the GAM1587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1587 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1587 RNA is designated SEQ ID:4168, and is provided hereinbelow with reference to the sequence listing part.

[22092] GAM1587 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1587 target RNA, herein designated GAM TARGET RNA. GAM1587 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22093] GAM1587 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1587 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1587 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1587 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1587 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22094] The complementary binding of GAM1587 RNA, herein designated GAM RNA, to target binding sites on GAM1587 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1587 target RNA, herein designated GAM TARGET RNA, into GAM1587 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22095] It is appreciated that GAM1587 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1587 target genes. The mRNA of each one of this plurality of GAM1587 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1587 RNA, herein designated GAM RNA, and which when bound by GAM1587 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1587 target proteins.

[22096] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1587 gene, herein designated GAM GENE, on one or more GAM1587 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22097] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1587 correlate with, and may be deduced from, the identity of the target

genes which GAM1587 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22098] Nucleotide sequences of the GAM1587 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1587 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1587 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1587 are further described hereinbelow with reference to Table 1.

[22099] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1587 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22100] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1588 (GAM1588) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22101] GAM1588 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1588 was detected is described hereinabove with reference to Figs. 2-8.

[22102] GAM1588 gene, herein designated GAM GENE, and GAM1588 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[22103] GAM1588 gene, herein designated GAM GENE, encodes a GAM1588 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1588 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1588 precursor RNA is designated SEQ ID:1565, and is provided hereinbelow with reference to the sequence listing part.

[22104] GAM1588 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22105] An enzyme complex designated DICER COMPLEX, dices the GAM1588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1588 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1588 RNA is designated SEQ ID:4169, and is provided

hereinbelow with reference to the sequence listing part.

[22106] GAM1588 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1588 target RNA, herein designated GAM TARGET RNA. GAM1588 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22107] GAM1588 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1588 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1588 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1588 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1588 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22108] The complementary binding of GAM1588 RNA, herein designated GAM RNA, to target binding sites on GAM1588 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1588 target RNA, herein designated GAM TARGET RNA, into GAM1588 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22109] It is appreciated that GAM1588 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1588 target genes. The mRNA of each one of this plurality of GAM1588 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1588 RNA, herein designated GAM RNA, and which when bound by GAM1588 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1588 target proteins.

[22110] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1588 gene, herein designated GAM GENE, on one or more GAM1588 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22111] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1588 correlate with, and may be deduced from, the identity of the target genes which GAM1588 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22112] Nucleotide sequences of the GAM1588 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1588 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1588 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1588 are further described hereinbelow with reference to Table 1.

[22113] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1588 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22114] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1589 (GAM1589) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22115] GAM1589 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1589 was detected is described hereinabove with reference to Figs. 2-8.

[22116] GAM1589 gene, herein designated GAM GENE, and GAM1589 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22117] GAM1589 gene, herein designated GAM GENE, encodes a GAM1589 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1589 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1589 precursor RNA is designated SEQ ID:1566, and is provided hereinbelow with reference to the sequence listing part.

[22118] GAM1589 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22119] An enzyme complex designated DICER COMPLEX, dices the GAM1589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1589 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1589 RNA is designated SEQ ID:4171, and is provided hereinbelow with reference to the sequence listing part.

[22120] GAM1589 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1589 target RNA, herein designated GAM TARGET RNA. GAM1589 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22121] GAM1589 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1589 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1589 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1589 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1589 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22122] The complementary binding of GAM1589 RNA, herein designated GAM RNA, to target binding sites on GAM1589 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1589 target RNA, herein designated GAM TARGET RNA, into GAM1589 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22123] It is appreciated that GAM1589 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1589 target genes. The mRNA of each one of this plurality of GAM1589 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1589 RNA, herein designated GAM RNA, and which when bound by GAM1589 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1589 target proteins.

[22124] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1589 gene, herein designated GAM GENE, on one or more GAM1589 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22125] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1589 correlate with, and may be deduced from, the identity of the target genes which GAM1589 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22126] Nucleotide sequences of the GAM1589 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1589 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1589 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1589 are further described hereinbelow with reference to Table 1.

[22127] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1589 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22128] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1590 (GAM1590) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22129] GAM1590 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1590 was detected is described hereinabove with reference to Figs. 2-8.

[22130] GAM1590 gene, herein designated GAM GENE, and GAM1590 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22131] GAM1590 gene, herein designated GAM GENE, encodes a GAM1590 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1590 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1590 precursor RNA is designated SEQ ID:1567, and is provided hereinbelow with reference to the sequence listing part.

[22132] GAM1590 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1590 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22133] An enzyme complex designated DICER COMPLEX, dices the GAM1590 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1590 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1590 RNA is designated SEQ ID:4172, and is provided hereinbelow with reference to the sequence listing part.

[22134] GAM1590 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1590 target RNA, herein designated GAM TARGET RNA. GAM1590 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22135] GAM1590 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1590 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1590 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1590 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1590 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22136] The complementary binding of GAM1590 RNA, herein designated GAM RNA, to target binding sites on GAM1590 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1590 target RNA, herein designated GAM TARGET RNA, into GAM1590 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22137] It is appreciated that GAM1590 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1590 target genes. The mRNA of each one of this plurality of GAM1590 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1590 RNA, herein designated GAM RNA, and which when bound by GAM1590 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1590 target proteins.

[22138] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1590 gene, herein designated GAM GENE, on one or more GAM1590 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22139] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1590 correlate with, and may be deduced from, the identity of the target genes which GAM1590 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22140] Nucleotide sequences of the GAM1590 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1590 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1590 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1590 are further described hereinbelow with reference to Table 1.

[22141] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1590 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[22142] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1591 (GAM1591) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22143] GAM1591 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1591 was detected is described hereinabove with reference to Figs. 2-8.

[22144] GAM1591 gene, herein designated GAM GENE, and GAM1591 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22145] GAM1591 gene, herein designated GAM GENE, encodes a GAM1591 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1591 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1591 precursor RNA is designated SEQ ID:1568, and is provided hereinbelow with reference to the sequence listing part.

[22146] GAM1591 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22147] An enzyme complex designated DICER COMPLEX, dices the GAM1591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1591 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 94%) nucleotide sequence of GAM1591 RNA is designated SEQ ID:4173, and is provided hereinbelow with reference to the sequence listing part.

[22148] GAM1591 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1591 target RNA, herein designated GAM TARGET RNA. GAM1591 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22149] GAM1591 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1591 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1591 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1591 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1591 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22150] The complementary binding of GAM1591 RNA, herein designated GAM RNA, to target binding sites on GAM1591 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1591 target RNA, herein designated GAM TARGET RNA, into GAM1591 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22151] It is appreciated that GAM1591 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1591 target genes. The mRNA of each one of this plurality of GAM1591 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1591 RNA, herein designated GAM RNA, and which when bound by GAM1591 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1591 target proteins.

[22152] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1591 gene, herein designated GAM GENE, on one or more GAM1591 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22153] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1591 correlate with, and may be deduced from, the identity of the target genes which GAM1591 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22154] Nucleotide sequences of the GAM1591 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1591 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1591 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1591 are further described hereinbelow with reference to Table 1.

[22155] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1591 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22156] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1592 (GAM1592) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22157] GAM1592 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1592 was detected is described hereinabove with reference to Figs. 2-8.

[22158] GAM1592 gene, herein designated GAM GENE, and GAM1592 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22159] GAM1592 gene, herein designated GAM GENE, encodes a GAM1592 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1592 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1592 precursor RNA is designated SEQ ID:1569, and is provided hereinbelow with reference to the sequence listing part.

[22160] GAM1592 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22161] An enzyme complex designated DICER COMPLEX, dices the GAM1592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1592 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1592 RNA is designated SEQ ID:4174, and is provided hereinbelow with reference to the sequence listing part.

[22162] GAM1592 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1592 target RNA, herein designated GAM TARGET RNA. GAM1592 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22163] GAM1592 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1592 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1592 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1592 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1592 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22164] The complementary binding of GAM1592 RNA, herein designated GAM RNA, to target binding sites on GAM1592 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1592 target RNA, herein designated GAM TARGET RNA, into GAM1592 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22165] It is appreciated that GAM1592 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1592 target genes. The

mRNA of each one of this plurality of GAM1592 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1592 RNA, herein designated GAM RNA, and which when bound by GAM1592 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1592 target proteins.

[22166] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1592 gene, herein designated GAM GENE, on one or more GAM1592 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22167] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1592 correlate with, and may be deduced from, the identity of the target genes which GAM1592 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22168] Nucleotide sequences of the GAM1592 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1592 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1592 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1592 are further described hereinbelow with reference to Table 1.

[22169] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1592 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22170] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1593 (GAM1593) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22171] GAM1593 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1593 was detected is described hereinabove with reference to Figs. 2-8.

[22172] GAM1593 gene, herein designated GAM GENE, and GAM1593 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22173] GAM1593 gene, herein designated GAM GENE, encodes a GAM1593 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1593 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1593 precursor RNA is designated SEQ ID:1570, and is provided hereinbelow with reference to the sequence listing part.

[22174] GAM1593 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1593 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22175] An enzyme complex designated DICER COMPLEX, dices the GAM1593 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1593 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1593 RNA is designated SEQ ID:4175, and is provided hereinbelow with reference to the sequence listing part.

[22176] GAM1593 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1593 target RNA, herein designated GAM TARGET RNA. GAM1593 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22177] GAM1593 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1593 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1593 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1593 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1593 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22178] The complementary binding of GAM1593 RNA, herein designated GAM RNA, to target binding sites on GAM1593 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1593 target RNA, herein designated GAM TARGET RNA, into GAM1593 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22179] It is appreciated that GAM1593 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1593 target genes. The mRNA of each one of this plurality of GAM1593 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1593 RNA, herein designated GAM RNA, and which when bound by GAM1593 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1593 target proteins.

[22180] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1593 gene, herein designated GAM GENE, on one or more GAM1593 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22181] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1593 correlate with, and may be deduced from, the identity of the target

genes which GAM1593 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22182] Nucleotide sequences of the GAM1593 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1593 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1593 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1593 are further described hereinbelow with reference to Table 1.

[22183] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1593 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22184] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1594 (GAM1594) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22185] GAM1594 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1594 was detected is described hereinabove with reference to Figs. 2-8.

[22186] GAM1594 gene, herein designated GAM GENE, and GAM1594 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[22187] GAM1594 gene, herein designated GAM GENE, encodes a GAM1594 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1594 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1594 precursor RNA is designated SEQ ID:1571, and is provided hereinbelow with reference to the sequence listing part.

[22188] GAM1594 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1594 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22189] An enzyme complex designated DICER COMPLEX, dices the GAM1594 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1594 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1594 RNA is designated SEQ ID:4176, and is provided

hereinbelow with reference to the sequence listing part.

[22190] GAM1594 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1594 target RNA, herein designated GAM TARGET RNA. GAM1594 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22191] GAM1594 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1594 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1594 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1594 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1594 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22192] The complementary binding of GAM1594 RNA, herein designated GAM RNA, to target binding sites on GAM1594 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1594 target RNA, herein designated GAM TARGET RNA, into GAM1594 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22193] It is appreciated that GAM1594 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1594 target genes. The mRNA of each one of this plurality of GAM1594 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1594 RNA, herein designated GAM RNA, and which when bound by GAM1594 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1594 target proteins.

[22194] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1594 gene, herein designated GAM GENE, on one or more GAM1594 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22195] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1594 correlate with, and may be deduced from, the identity of the target genes which GAM1594 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22196] Nucleotide sequences of the GAM1594 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1594 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1594 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1594 are further described hereinbelow with reference to Table 1.

[22197] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1594 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22198] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1595 (GAM1595) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22199] GAM1595 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1595 was detected is described hereinabove with reference to Figs. 2-8.

[22200] GAM1595 gene, herein designated GAM GENE, and GAM1595 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22201] GAM1595 gene, herein designated GAM GENE, encodes a GAM1595 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1595 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1595 precursor RNA is designated SEQ ID:1572, and is provided hereinbelow with reference to the sequence listing part.

[22202] GAM1595 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22203] An enzyme complex designated DICER COMPLEX, dices the GAM1595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1595 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1595 RNA is designated SEQ ID:4177, and is provided hereinbelow with reference to the sequence listing part.

[22204] GAM1595 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1595 target RNA, herein designated GAM TARGET RNA. GAM1595 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22205] GAM1595 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1595 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1595 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1595 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1595 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22206] The complementary binding of GAM1595 RNA, herein designated GAM RNA, to target binding sites on GAM1595 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1595 target RNA, herein designated GAM TARGET RNA, into GAM1595 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22207] It is appreciated that GAM1595 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1595 target genes. The mRNA of each one of this plurality of GAM1595 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1595 RNA, herein designated GAM RNA, and which when bound by GAM1595 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1595 target proteins.

[22208] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1595 gene, herein designated GAM GENE, on one or more GAM1595 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22209] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1595 correlate with, and may be deduced from, the identity of the target genes which GAM1595 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22210] Nucleotide sequences of the GAM1595 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1595 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1595 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1595 are further described hereinbelow with reference to Table 1.

[22211] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1595 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22212] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1596 (GAM1596) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22213] GAM1596 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1596 was detected is described hereinabove with reference to Figs. 2-8.

[22214] GAM1596 gene, herein designated GAM GENE, and GAM1596 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22215] GAM1596 gene, herein designated GAM GENE, encodes a GAM1596 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1596 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1596 precursor RNA is designated SEQ ID:1573, and is provided hereinbelow with reference to the sequence listing part.

[22216] GAM1596 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1596 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22217] An enzyme complex designated DICER COMPLEX, dices the GAM1596 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1596 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1596 RNA is designated SEQ ID:4180, and is provided hereinbelow with reference to the sequence listing part.

[22218] GAM1596 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1596 target RNA, herein designated GAM TARGET RNA. GAM1596 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22219] GAM1596 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1596 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1596 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1596 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1596 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22220] The complementary binding of GAM1596 RNA, herein designated GAM RNA, to target binding sites on GAM1596 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1596 target RNA, herein designated GAM TARGET RNA, into GAM1596 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22221] It is appreciated that GAM1596 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1596 target genes. The mRNA of each one of this plurality of GAM1596 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1596 RNA, herein designated GAM RNA, and which when bound by GAM1596 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1596 target proteins.

[22222] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1596 gene, herein designated GAM GENE, on one or more GAM1596 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22223] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1596 correlate with, and may be deduced from, the identity of the target genes which GAM1596 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22224] Nucleotide sequences of the GAM1596 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1596 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1596 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1596 are further described hereinbelow with reference to Table 1.

[22225] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1596 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[22226] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1597 (GAM1597) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22227] GAM1597 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1597 was detected is described hereinabove with reference to Figs. 2-8.

[22228] GAM1597 gene, herein designated GAM GENE, and GAM1597 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22229] GAM1597 gene, herein designated GAM GENE, encodes a GAM1597 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1597 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1597 precursor RNA is designated SEQ ID:1574, and is provided hereinbelow with reference to the sequence listing part.

[22230] GAM1597 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22231] An enzyme complex designated DICER COMPLEX, dices the GAM1597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1597 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1597 RNA is designated SEQ ID:4178, and is provided hereinbelow with reference to the sequence listing part.

[22232] GAM1597 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1597 target RNA, herein designated GAM TARGET RNA. GAM1597 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22233] GAM1597 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1597 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1597 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1597 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1597 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22234] The complementary binding of GAM1597 RNA, herein designated GAM RNA, to target binding sites on GAM1597 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1597 target RNA, herein designated GAM TARGET RNA, into GAM1597 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22235] It is appreciated that GAM1597 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1597 target genes. The mRNA of each one of this plurality of GAM1597 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1597 RNA, herein designated GAM RNA, and which when bound by GAM1597 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1597 target proteins.

[22236] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1597 gene, herein designated GAM GENE, on one or more GAM1597 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22237] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1597 correlate with, and may be deduced from, the identity of the target genes which GAM1597 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22238] Nucleotide sequences of the GAM1597 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1597 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1597 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1597 are further described hereinbelow with reference to Table 1.

[22239] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1597 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22240] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1598 (GAM1598) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22241] GAM1598 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1598 was detected is described hereinabove with reference to Figs. 2-8.

[22242] GAM1598 gene, herein designated GAM GENE, and GAM1598 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22243] GAM1598 gene, herein designated GAM GENE, encodes a GAM1598 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1598 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1598 precursor RNA is designated SEQ ID:1575, and is provided hereinbelow with reference to the sequence listing part.

[22244] GAM1598 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22245] An enzyme complex designated DICER COMPLEX, dices the GAM1598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1598 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1598 RNA is designated SEQ ID:4179, and is provided hereinbelow with reference to the sequence listing part.

[22246] GAM1598 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1598 target RNA, herein designated GAM TARGET RNA. GAM1598 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22247] GAM1598 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1598 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1598 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1598 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1598 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22248] The complementary binding of GAM1598 RNA, herein designated GAM RNA, to target binding sites on GAM1598 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1598 target RNA, herein designated GAM TARGET RNA, into GAM1598 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22249] It is appreciated that GAM1598 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1598 target genes. The

mRNA of each one of this plurality of GAM1598 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1598 RNA, herein designated GAM RNA, and which when bound by GAM1598 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1598 target proteins.

[22250] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1598 gene, herein designated GAM GENE, on one or more GAM1598 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22251] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1598 correlate with, and may be deduced from, the identity of the target genes which GAM1598 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22252] Nucleotide sequences of the GAM1598 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1598 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1598 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1598 are further described hereinbelow with reference to Table 1.

[22253] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1598 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22254] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1599 (GAM1599) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22255] GAM1599 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1599 was detected is described hereinabove with reference to Figs. 2-8.

[22256] GAM1599 gene, herein designated GAM GENE, and GAM1599 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22257] GAM1599 gene, herein designated GAM GENE, encodes a GAM1599 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1599 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1599 precursor RNA is designated SEQ ID:1576, and is provided hereinbelow with reference to the sequence listing part.

[22258] GAM1599 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22259] An enzyme complex designated DICER COMPLEX, dices the GAM1599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1599 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1599 RNA is designated SEQ ID:4181, and is provided hereinbelow with reference to the sequence listing part.

[22260] GAM1599 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1599 target RNA, herein designated GAM TARGET RNA. GAM1599 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22261] GAM1599 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1599 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1599 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1599 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1599 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22262] The complementary binding of GAM1599 RNA, herein designated GAM RNA, to target binding sites on GAM1599 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1599 target RNA, herein designated GAM TARGET RNA, into GAM1599 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22263] It is appreciated that GAM1599 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1599 target genes. The mRNA of each one of this plurality of GAM1599 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1599 RNA, herein designated GAM RNA, and which when bound by GAM1599 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1599 target proteins.

[22264] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1599 gene, herein designated GAM GENE, on one or more GAM1599 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22265] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1599 correlate with, and may be deduced from, the identity of the target

genes which GAM1599 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22266] Nucleotide sequences of the GAM1599 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1599 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1599 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1599 are further described hereinbelow with reference to Table 1.

[22267] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1599 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22268] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1600 (GAM1600) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22269] GAM1600 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1600 was detected is described hereinabove with reference to Figs. 2-8.

[22270] GAM1600 gene, herein designated GAM GENE, and GAM1600 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[22271] GAM1600 gene, herein designated GAM GENE, encodes a GAM1600 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1600 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1600 precursor RNA is designated SEQ ID:1577, and is provided hereinbelow with reference to the sequence listing part.

[22272] GAM1600 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1600 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22273] An enzyme complex designated DICER COMPLEX, dices the GAM1600 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1600 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1600 RNA is designated SEQ ID:4182, and is provided

hereinbelow with reference to the sequence listing part.

[22274] GAM1600 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1600 target RNA, herein designated GAM TARGET RNA. GAM1600 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22275] GAM1600 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1600 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1600 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1600 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1600 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22276] The complementary binding of GAM1600 RNA, herein designated GAM RNA, to target binding sites on GAM1600 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1600 target RNA, herein designated GAM TARGET RNA, into GAM1600 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22277] It is appreciated that GAM1600 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1600 target genes. The mRNA of each one of this plurality of GAM1600 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1600 RNA, herein designated GAM RNA, and which when bound by GAM1600 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1600 target proteins.

[22278] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1600 gene, herein designated GAM GENE, on one or more GAM1600 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22279] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1600 correlate with, and may be deduced from, the identity of the target genes which GAM1600 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22280] Nucleotide sequences of the GAM1600 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1600 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1600 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1600 are further described hereinbelow with reference to Table 1.

[22281] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1600 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22282] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1601 (GAM1601) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22283] GAM1601 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1601 was detected is described hereinabove with reference to Figs. 2-8.

[22284] GAM1601 gene, herein designated GAM GENE, and GAM1601 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22285] GAM1601 gene, herein designated GAM GENE, encodes a GAM1601 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1601 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1601 precursor RNA is designated SEQ ID:1578, and is provided hereinbelow with reference to the sequence listing part.

[22286] GAM1601 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22287] An enzyme complex designated DICER COMPLEX, dices the GAM1601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1601 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1601 RNA is designated SEQ ID:4183, and is provided hereinbelow with reference to the sequence listing part.

[22288] GAM1601 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1601 target RNA, herein designated GAM TARGET RNA. GAM1601 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22289] GAM1601 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1601 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1601 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1601 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1601 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22290] The complementary binding of GAM1601 RNA, herein designated GAM RNA, to target binding sites on GAM1601 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1601 target RNA, herein designated GAM TARGET RNA, into GAM1601 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22291] It is appreciated that GAM1601 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1601 target genes. The mRNA of each one of this plurality of GAM1601 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1601 RNA, herein designated GAM RNA, and which when bound by GAM1601 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1601 target proteins.

[22292] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1601 gene, herein designated GAM GENE, on one or more GAM1601 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22293] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1601 correlate with, and may be deduced from, the identity of the target genes which GAM1601 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22294] Nucleotide sequences of the GAM1601 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1601 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1601 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1601 are further described hereinbelow with reference to Table 1.

[22295] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1601 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22296] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1602 (GAM1602) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22297] GAM1602 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1602 was detected is described hereinabove with reference to Figs. 2-8.

[22298] GAM1602 gene, herein designated GAM GENE, and GAM1602 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22299] GAM1602 gene, herein designated GAM GENE, encodes a GAM1602 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1602 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1602 precursor RNA is designated SEQ ID:1579, and is provided hereinbelow with reference to the sequence listing part.

[22300] GAM1602 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22301] An enzyme complex designated DICER COMPLEX, dices the GAM1602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1602 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1602 RNA is designated SEQ ID:4184, and is provided hereinbelow with reference to the sequence listing part.

[22302] GAM1602 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1602 target RNA, herein designated GAM TARGET RNA. GAM1602 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22303] GAM1602 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1602 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1602 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1602 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1602 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22304] The complementary binding of GAM1602 RNA, herein designated GAM RNA, to target binding sites on GAM1602 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1602 target RNA, herein designated GAM TARGET RNA, into GAM1602 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22305] It is appreciated that GAM1602 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1602 target genes. The mRNA of each one of this plurality of GAM1602 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1602 RNA, herein designated GAM RNA, and which when bound by GAM1602 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1602 target proteins.

[22306] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1602 gene, herein designated GAM GENE, on one or more GAM1602 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22307] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1602 correlate with, and may be deduced from, the identity of the target genes which GAM1602 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22308] Nucleotide sequences of the GAM1602 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1602 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1602 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1602 are further described hereinbelow with reference to Table 1.

[22309] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1602 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[22310] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1603 (GAM1603) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22311] GAM1603 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1603 was detected is described hereinabove with reference to Figs. 2-8.

[22312] GAM1603 gene, herein designated GAM GENE, and GAM1603 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22313] GAM1603 gene, herein designated GAM GENE, encodes a GAM1603 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1603 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1603 precursor RNA is designated SEQ ID:1580, and is provided hereinbelow with reference to the sequence listing part.

[22314] GAM1603 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1603 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22315] An enzyme complex designated DICER COMPLEX, dices the GAM1603 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1603 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1603 RNA is designated SEQ ID:4185, and is provided hereinbelow with reference to the sequence listing part.

[22316] GAM1603 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1603 target RNA, herein designated GAM TARGET RNA. GAM1603 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22317] GAM1603 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1603 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1603 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1603 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1603 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22318] The complementary binding of GAM1603 RNA, herein designated GAM RNA, to target binding sites on GAM1603 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1603 target RNA, herein designated GAM TARGET RNA, into GAM1603 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22319] It is appreciated that GAM1603 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1603 target genes. The mRNA of each one of this plurality of GAM1603 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1603 RNA, herein designated GAM RNA, and which when bound by GAM1603 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1603 target proteins.

[22320] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1603 gene, herein designated GAM GENE, on one or more GAM1603 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22321] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1603 correlate with, and may be deduced from, the identity of the target genes which GAM1603 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22322] Nucleotide sequences of the GAM1603 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1603 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1603 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1603 are further described hereinbelow with reference to Table 1.

[22323] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1603 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22324] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1604 (GAM1604) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22325] GAM1604 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1604 was detected is described hereinabove with reference to Figs. 2-8.

[22326] GAM1604 gene, herein designated GAM GENE, and GAM1604 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22327] GAM1604 gene, herein designated GAM GENE, encodes a GAM1604 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1604 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1604 precursor RNA is designated SEQ ID:1581, and is provided hereinbelow with reference to the sequence listing part.

[22328] GAM1604 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1604 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22329] An enzyme complex designated DICER COMPLEX, dices the GAM1604 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1604 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1604 RNA is designated SEQ ID:4186, and is provided hereinbelow with reference to the sequence listing part.

[22330] GAM1604 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1604 target RNA, herein designated GAM TARGET RNA. GAM1604 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22331] GAM1604 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1604 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1604 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1604 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1604 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22332] The complementary binding of GAM1604 RNA, herein designated GAM RNA, to target binding sites on GAM1604 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1604 target RNA, herein designated GAM TARGET RNA, into GAM1604 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22333] It is appreciated that GAM1604 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1604 target genes. The

mRNA of each one of this plurality of GAM1604 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1604 RNA, herein designated GAM RNA, and which when bound by GAM1604 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1604 target proteins.

[22334] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1604 gene, herein designated GAM GENE, on one or more GAM1604 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22335] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1604 correlate with, and may be deduced from, the identity of the target genes which GAM1604 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22336] Nucleotide sequences of the GAM1604 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1604 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1604 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1604 are further described hereinbelow with reference to Table 1.

[22337] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1604 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22338] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1605 (GAM1605) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22339] GAM1605 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1605 was detected is described hereinabove with reference to Figs. 2-8.

[22340] GAM1605 gene, herein designated GAM GENE, and GAM1605 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22341] GAM1605 gene, herein designated GAM GENE, encodes a GAM1605 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1605 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1605 precursor RNA is designated SEQ ID:1582, and is provided hereinbelow with reference to the sequence listing part.

[22342] GAM1605 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22343] An enzyme complex designated DICER COMPLEX, dices the GAM1605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1605 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1605 RNA is designated SEQ ID:4187, and is provided hereinbelow with reference to the sequence listing part.

[22344] GAM1605 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1605 target RNA, herein designated GAM TARGET RNA. GAM1605 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22345] GAM1605 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1605 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1605 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1605 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1605 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22346] The complementary binding of GAM1605 RNA, herein designated GAM RNA, to target binding sites on GAM1605 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1605 target RNA, herein designated GAM TARGET RNA, into GAM1605 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22347] It is appreciated that GAM1605 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1605 target genes. The mRNA of each one of this plurality of GAM1605 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1605 RNA, herein designated GAM RNA, and which when bound by GAM1605 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1605 target proteins.

[22348] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1605 gene, herein designated GAM GENE, on one or more GAM1605 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22349] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1605 correlate with, and may be deduced from, the identity of the target

genes which GAM1605 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22350] Nucleotide sequences of the GAM1605 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1605 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1605 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1605 are further described hereinbelow with reference to Table 1.

[22351] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1605 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22352] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1606 (GAM1606) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22353] GAM1606 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1606 was detected is described hereinabove with reference to Figs. 2-8.

[22354] GAM1606 gene, herein designated GAM GENE, and GAM1606 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[22355] GAM1606 gene, herein designated GAM GENE, encodes a GAM1606 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1606 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1606 precursor RNA is designated SEQ ID:1583, and is provided hereinbelow with reference to the sequence listing part.

[22356] GAM1606 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22357] An enzyme complex designated DICER COMPLEX, dices the GAM1606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1606 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1606 RNA is designated SEQ ID:4188, and is provided

hereinbelow with reference to the sequence listing part.

[22358] GAM1606 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1606 target RNA, herein designated GAM TARGET RNA. GAM1606 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22359] GAM1606 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1606 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1606 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1606 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1606 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22360] The complementary binding of GAM1606 RNA, herein designated GAM RNA, to target binding sites on GAM1606 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1606 target RNA, herein designated GAM TARGET RNA, into GAM1606 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22361] It is appreciated that GAM1606 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1606 target genes. The mRNA of each one of this plurality of GAM1606 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1606 RNA, herein designated GAM RNA, and which when bound by GAM1606 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1606 target proteins.

[22362] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1606 gene, herein designated GAM GENE, on one or more GAM1606 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22363] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1606 correlate with, and may be deduced from, the identity of the target genes which GAM1606 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22364] Nucleotide sequences of the GAM1606 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1606 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1606 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1606 are further described hereinbelow with reference to Table 1.

[22365] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1606 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22366] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1607 (GAM1607) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22367] GAM1607 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1607 was detected is described hereinabove with reference to Figs. 2-8.

[22368] GAM1607 gene, herein designated GAM GENE, and GAM1607 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22369] GAM1607 gene, herein designated GAM GENE, encodes a GAM1607 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1607 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1607 precursor RNA is designated SEQ ID:1584, and is provided hereinbelow with reference to the sequence listing part.

[22370] GAM1607 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22371] An enzyme complex designated DICER COMPLEX, dices the GAM1607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1607 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1607 RNA is designated SEQ ID:4190, and is provided hereinbelow with reference to the sequence listing part.

[22372] GAM1607 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1607 target RNA, herein designated GAM TARGET RNA. GAM1607 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22373] GAM1607 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1607 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1607 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1607 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1607 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22374] The complementary binding of GAM1607 RNA, herein designated GAM RNA, to target binding sites on GAM1607 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1607 target RNA, herein designated GAM TARGET RNA, into GAM1607 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22375] It is appreciated that GAM1607 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1607 target genes. The mRNA of each one of this plurality of GAM1607 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1607 RNA, herein designated GAM RNA, and which when bound by GAM1607 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1607 target proteins.

[22376] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1607 gene, herein designated GAM GENE, on one or more GAM1607 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22377] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1607 correlate with, and may be deduced from, the identity of the target genes which GAM1607 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22378] Nucleotide sequences of the GAM1607 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1607 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1607 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1607 are further described hereinbelow with reference to Table 1.

[22379] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1607 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22380] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1608 (GAM1608) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22381] GAM1608 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1608 was detected is described hereinabove with reference to Figs. 2-8.

[22382] GAM1608 gene, herein designated GAM GENE, and GAM1608 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22383] GAM1608 gene, herein designated GAM GENE, encodes a GAM1608 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1608 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1608 precursor RNA is designated SEQ ID:1585, and is provided hereinbelow with reference to the sequence listing part.

[22384] GAM1608 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22385] An enzyme complex designated DICER COMPLEX, dices the GAM1608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1608 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1608 RNA is designated SEQ ID:4189, and is provided hereinbelow with reference to the sequence listing part.

[22386] GAM1608 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1608 target RNA, herein designated GAM TARGET RNA. GAM1608 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22387] GAM1608 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1608 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1608 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1608 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1608 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22388] The complementary binding of GAM1608 RNA, herein designated GAM RNA, to target binding sites on GAM1608 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1608 target RNA, herein designated GAM TARGET RNA, into GAM1608 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22389] It is appreciated that GAM1608 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1608 target genes. The mRNA of each one of this plurality of GAM1608 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1608 RNA, herein designated GAM RNA, and which when bound by GAM1608 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1608 target proteins.

[22390] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1608 gene, herein designated GAM GENE, on one or more GAM1608 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22391] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1608 correlate with, and may be deduced from, the identity of the target genes which GAM1608 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22392] Nucleotide sequences of the GAM1608 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1608 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1608 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1608 are further described hereinbelow with reference to Table 1.

[22393] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1608 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[22394] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1609 (GAM1609) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22395] GAM1609 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1609 was detected is described hereinabove with reference to Figs. 2-8.

[22396] GAM1609 gene, herein designated GAM GENE, and GAM1609 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22397] GAM1609 gene, herein designated GAM GENE, encodes a GAM1609 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1609 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1609 precursor RNA is designated SEQ ID:1586, and is provided hereinbelow with reference to the sequence listing part.

[22398] GAM1609 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1609 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22399] An enzyme complex designated DICER COMPLEX, dices the GAM1609 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1609 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1609 RNA is designated SEQ ID:4191, and is provided hereinbelow with reference to the sequence listing part.

[22400] GAM1609 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1609 target RNA, herein designated GAM TARGET RNA. GAM1609 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22401] GAM1609 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1609 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1609 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1609 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1609 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22402] The complementary binding of GAM1609 RNA, herein designated GAM RNA, to target binding sites on GAM1609 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1609 target RNA, herein designated GAM TARGET RNA, into GAM1609 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22403] It is appreciated that GAM1609 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1609 target genes. The mRNA of each one of this plurality of GAM1609 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1609 RNA, herein designated GAM RNA, and which when bound by GAM1609 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1609 target proteins.

[22404] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1609 gene, herein designated GAM GENE, on one or more GAM1609 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22405] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1609 correlate with, and may be deduced from, the identity of the target genes which GAM1609 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22406] Nucleotide sequences of the GAM1609 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1609 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1609 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1609 are further described hereinbelow with reference to Table 1.

[22407] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1609 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22408] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1610 (GAM1610) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22409] GAM1610 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1610 was detected is described hereinabove with reference to Figs. 2-8.

[22410] GAM1610 gene, herein designated GAM GENE, and GAM1610 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22411] GAM1610 gene, herein designated GAM GENE, encodes a GAM1610 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1610 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1610 precursor RNA is designated SEQ ID:1587, and is provided hereinbelow with reference to the sequence listing part.

[22412] GAM1610 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1610 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22413] An enzyme complex designated DICER COMPLEX, dices the GAM1610 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1610 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1610 RNA is designated SEQ ID:4192, and is provided hereinbelow with reference to the sequence listing part.

[22414] GAM1610 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1610 target RNA, herein designated GAM TARGET RNA. GAM1610 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22415] GAM1610 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1610 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1610 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1610 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1610 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22416] The complementary binding of GAM1610 RNA, herein designated GAM RNA, to target binding sites on GAM1610 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1610 target RNA, herein designated GAM TARGET RNA, into GAM1610 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22417] It is appreciated that GAM1610 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1610 target genes. The

mRNA of each one of this plurality of GAM1610 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1610 RNA, herein designated GAM RNA, and which when bound by GAM1610 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1610 target proteins.

[22418] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1610 gene, herein designated GAM GENE, on one or more GAM1610 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22419] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1610 correlate with, and may be deduced from, the identity of the target genes which GAM1610 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22420] Nucleotide sequences of the GAM1610 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1610 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1610 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1610 are further described hereinbelow with reference to Table 1.

[22421] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1610 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22422] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1611 (GAM1611) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22423] GAM1611 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1611 was detected is described hereinabove with reference to Figs. 2-8.

[22424] GAM1611 gene, herein designated GAM GENE, and GAM1611 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22425] GAM1611 gene, herein designated GAM GENE, encodes a GAM1611 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1611 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1611 precursor RNA is designated SEQ ID:1588, and is provided hereinbelow with reference to the sequence listing part.

[22426] GAM1611 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1611 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22427] An enzyme complex designated DICER COMPLEX, dices the GAM1611 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1611 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1611 RNA is designated SEQ ID:4193, and is provided hereinbelow with reference to the sequence listing part.

[22428] GAM1611 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1611 target RNA, herein designated GAM TARGET RNA. GAM1611 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22429] GAM1611 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1611 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1611 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1611 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1611 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22430] The complementary binding of GAM1611 RNA, herein designated GAM RNA, to target binding sites on GAM1611 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1611 target RNA, herein designated GAM TARGET RNA, into GAM1611 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22431] It is appreciated that GAM1611 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1611 target genes. The mRNA of each one of this plurality of GAM1611 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1611 RNA, herein designated GAM RNA, and which when bound by GAM1611 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1611 target proteins.

[22432] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1611 gene, herein designated GAM GENE, on one or more GAM1611 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22433] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1611 correlate with, and may be deduced from, the identity of the target

genes which GAM1611 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22434] Nucleotide sequences of the GAM1611 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1611 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1611 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1611 are further described hereinbelow with reference to Table 1.

[22435] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1611 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22436] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1612 (GAM1612) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22437] GAM1612 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1612 was detected is described hereinabove with reference to Figs. 2-8.

[22438] GAM1612 gene, herein designated GAM GENE, and GAM1612 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[22439] GAM1612 gene, herein designated GAM GENE, encodes a GAM1612 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1612 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1612 precursor RNA is designated SEQ ID:1589, and is provided hereinbelow with reference to the sequence listing part.

[22440] GAM1612 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1612 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22441] An enzyme complex designated DICER COMPLEX, dices the GAM1612 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1612 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1612 RNA is designated SEQ ID:4194, and is provided

hereinbelow with reference to the sequence listing part.

[22442] GAM1612 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1612 target RNA, herein designated GAM TARGET RNA. GAM1612 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22443] GAM1612 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1612 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1612 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1612 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1612 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22444] The complementary binding of GAM1612 RNA, herein designated GAM RNA, to target binding sites on GAM1612 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1612 target RNA, herein designated GAM TARGET RNA, into GAM1612 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22445] It is appreciated that GAM1612 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1612 target genes. The mRNA of each one of this plurality of GAM1612 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1612 RNA, herein designated GAM RNA, and which when bound by GAM1612 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1612 target proteins.

[22446] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1612 gene, herein designated GAM GENE, on one or more GAM1612 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22447] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1612 correlate with, and may be deduced from, the identity of the target genes which GAM1612 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22448] Nucleotide sequences of the GAM1612 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1612 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1612 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1612 are further described hereinbelow with reference to Table 1.

[22449] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1612 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22450] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1613 (GAM1613) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22451] GAM1613 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1613 was detected is described hereinabove with reference to Figs. 2-8.

[22452] GAM1613 gene, herein designated GAM GENE, and GAM1613 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22453] GAM1613 gene, herein designated GAM GENE, encodes a GAM1613 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1613 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1613 precursor RNA is designated SEQ ID:1590, and is provided hereinbelow with reference to the sequence listing part.

[22454] GAM1613 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1613 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22455] An enzyme complex designated DICER COMPLEX, dices the GAM1613 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1613 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1613 RNA is designated SEQ ID:4195, and is provided hereinbelow with reference to the sequence listing part.

[22456] GAM1613 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1613 target RNA, herein designated GAM TARGET RNA. GAM1613 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22457] GAM1613 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1613 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1613 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1613 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1613 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22458] The complementary binding of GAM1613 RNA, herein designated GAM RNA, to target binding sites on GAM1613 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1613 target RNA, herein designated GAM TARGET RNA, into GAM1613 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22459] It is appreciated that GAM1613 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1613 target genes. The mRNA of each one of this plurality of GAM1613 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1613 RNA, herein designated GAM RNA, and which when bound by GAM1613 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1613 target proteins.

[22460] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1613 gene, herein designated GAM GENE, on one or more GAM1613 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22461] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1613 correlate with, and may be deduced from, the identity of the target genes which GAM1613 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22462] Nucleotide sequences of the GAM1613 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1613 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1613 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1613 are further described hereinbelow with reference to Table 1.

[22463] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1613 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22464] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1614 (GAM1614) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22465] GAM1614 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1614 was detected is described hereinabove with reference to Figs. 2-8.

[22466] GAM1614 gene, herein designated GAM GENE, and GAM1614 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22467] GAM1614 gene, herein designated GAM GENE, encodes a GAM1614 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1614 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1614 precursor RNA is designated SEQ ID:1591, and is provided hereinbelow with reference to the sequence listing part.

[22468] GAM1614 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22469] An enzyme complex designated DICER COMPLEX, dices the GAM1614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1614 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1614 RNA is designated SEQ ID:4196, and is provided hereinbelow with reference to the sequence listing part.

[22470] GAM1614 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1614 target RNA, herein designated GAM TARGET RNA. GAM1614 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22471] GAM1614 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1614 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1614 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1614 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1614 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22472] The complementary binding of GAM1614 RNA, herein designated GAM RNA, to target binding sites on GAM1614 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1614 target RNA, herein designated GAM TARGET RNA, into GAM1614 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22473] It is appreciated that GAM1614 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1614 target genes. The mRNA of each one of this plurality of GAM1614 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1614 RNA, herein designated GAM RNA, and which when bound by GAM1614 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1614 target proteins.

[22474] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1614 gene, herein designated GAM GENE, on one or more GAM1614 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22475] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1614 correlate with, and may be deduced from, the identity of the target genes which GAM1614 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22476] Nucleotide sequences of the GAM1614 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1614 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1614 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1614 are further described hereinbelow with reference to Table 1.

[22477] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1614 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[22478] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1615 (GAM1615) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22479] GAM1615 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1615 was detected is described hereinabove with reference to Figs. 2-8.

[22480] GAM1615 gene, herein designated GAM GENE, and GAM1615 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22481] GAM1615 gene, herein designated GAM GENE, encodes a GAM1615 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1615 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1615 precursor RNA is designated SEQ ID:1592, and is provided hereinbelow with reference to the sequence listing part.

[22482] GAM1615 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22483] An enzyme complex designated DICER COMPLEX, dices the GAM1615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1615 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1615 RNA is designated SEQ ID:4197, and is provided hereinbelow with reference to the sequence listing part.

[22484] GAM1615 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1615 target RNA, herein designated GAM TARGET RNA. GAM1615 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22485] GAM1615 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1615 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1615 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1615 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1615 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22486] The complementary binding of GAM1615 RNA, herein designated GAM RNA, to target binding sites on GAM1615 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1615 target RNA, herein designated GAM TARGET RNA, into GAM1615 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22487] It is appreciated that GAM1615 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1615 target genes. The mRNA of each one of this plurality of GAM1615 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1615 RNA, herein designated GAM RNA, and which when bound by GAM1615 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1615 target proteins.

[22488] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1615 gene, herein designated GAM GENE, on one or more GAM1615 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22489] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1615 correlate with, and may be deduced from, the identity of the target genes which GAM1615 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22490] Nucleotide sequences of the GAM1615 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1615 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1615 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1615 are further described hereinbelow with reference to Table 1.

[22491] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1615 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22492] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1616 (GAM1616) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22493] GAM1616 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1616 was detected is described hereinabove with reference to Figs. 2-8.

[22494] GAM1616 gene, herein designated GAM GENE, and GAM1616 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22495] GAM1616 gene, herein designated GAM GENE, encodes a GAM1616 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1616 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1616 precursor RNA is designated SEQ ID:1593, and is provided hereinbelow with reference to the sequence listing part.

[22496] GAM1616 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1616 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22497] An enzyme complex designated DICER COMPLEX, dices the GAM1616 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1616 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1616 RNA is designated SEQ ID:4199, and is provided hereinbelow with reference to the sequence listing part.

[22498] GAM1616 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1616 target RNA, herein designated GAM TARGET RNA. GAM1616 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22499] GAM1616 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1616 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1616 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1616 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1616 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22500] The complementary binding of GAM1616 RNA, herein designated GAM RNA, to target binding sites on GAM1616 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1616 target RNA, herein designated GAM TARGET RNA, into GAM1616 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22501] It is appreciated that GAM1616 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1616 target genes. The

mRNA of each one of this plurality of GAM1616 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1616 RNA, herein designated GAM RNA, and which when bound by GAM1616 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1616 target proteins.

[22502] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1616 gene, herein designated GAM GENE, on one or more GAM1616 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22503] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1616 correlate with, and may be deduced from, the identity of the target genes which GAM1616 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22504] Nucleotide sequences of the GAM1616 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1616 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1616 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1616 are further described hereinbelow with reference to Table 1.

[22505] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1616 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22506] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1617 (GAM1617) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22507] GAM1617 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1617 was detected is described hereinabove with reference to Figs. 2-8.

[22508] GAM1617 gene, herein designated GAM GENE, and GAM1617 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22509] GAM1617 gene, herein designated GAM GENE, encodes a GAM1617 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1617 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1617 precursor RNA is designated SEQ ID:1594, and is provided hereinbelow with reference to the sequence listing part.

[22510] GAM1617 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22511] An enzyme complex designated DICER COMPLEX, dices the GAM1617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1617 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1617 RNA is designated SEQ ID:4198, and is provided hereinbelow with reference to the sequence listing part.

[22512] GAM1617 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1617 target RNA, herein designated GAM TARGET RNA. GAM1617 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22513] GAM1617 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1617 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1617 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1617 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1617 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22514] The complementary binding of GAM1617 RNA, herein designated GAM RNA, to target binding sites on GAM1617 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1617 target RNA, herein designated GAM TARGET RNA, into GAM1617 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22515] It is appreciated that GAM1617 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1617 target genes. The mRNA of each one of this plurality of GAM1617 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1617 RNA, herein designated GAM RNA, and which when bound by GAM1617 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1617 target proteins.

[22516] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1617 gene, herein designated GAM GENE, on one or more GAM1617 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22517] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1617 correlate with, and may be deduced from, the identity of the target

genes which GAM1617 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22518] Nucleotide sequences of the GAM1617 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1617 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1617 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1617 are further described hereinbelow with reference to Table 1.

[22519] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1617 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22520] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1618 (GAM1618) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22521] GAM1618 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1618 was detected is described hereinabove with reference to Figs. 2-8.

[22522] GAM1618 gene, herein designated GAM GENE, and GAM1618 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[22523] GAM1618 gene, herein designated GAM GENE, encodes a GAM1618 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1618 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1618 precursor RNA is designated SEQ ID:1595, and is provided hereinbelow with reference to the sequence listing part.

[22524] GAM1618 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22525] An enzyme complex designated DICER COMPLEX, dices the GAM1618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1618 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1618 RNA is designated SEQ ID:4201, and is provided

hereinbelow with reference to the sequence listing part.

[22526] GAM1618 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1618 target RNA, herein designated GAM TARGET RNA. GAM1618 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22527] GAM1618 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1618 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1618 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1618 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1618 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22528] The complementary binding of GAM1618 RNA, herein designated GAM RNA, to target binding sites on GAM1618 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1618 target RNA, herein designated GAM TARGET RNA, into GAM1618 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22529] It is appreciated that GAM1618 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1618 target genes. The mRNA of each one of this plurality of GAM1618 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1618 RNA, herein designated GAM RNA, and which when bound by GAM1618 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1618 target proteins.

[22530] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1618 gene, herein designated GAM GENE, on one or more GAM1618 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22531] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1618 correlate with, and may be deduced from, the identity of the target genes which GAM1618 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22532] Nucleotide sequences of the GAM1618 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1618 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1618 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1618 are further described hereinbelow with reference to Table 1.

[22533] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1618 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22534] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1619 (GAM1619) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22535] GAM1619 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1619 was detected is described hereinabove with reference to Figs. 2-8.

[22536] GAM1619 gene, herein designated GAM GENE, and GAM1619 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22537] GAM1619 gene, herein designated GAM GENE, encodes a GAM1619 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1619 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1619 precursor RNA is designated SEQ ID:1596, and is provided hereinbelow with reference to the sequence listing part.

[22538] GAM1619 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22539] An enzyme complex designated DICER COMPLEX, dices the GAM1619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1619 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1619 RNA is designated SEQ ID:4200, and is provided hereinbelow with reference to the sequence listing part.

[22540] GAM1619 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1619 target RNA, herein designated GAM TARGET RNA. GAM1619 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22541] GAM1619 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1619 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1619 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1619 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1619 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22542] The complementary binding of GAM1619 RNA, herein designated GAM RNA, to target binding sites on GAM1619 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1619 target RNA, herein designated GAM TARGET RNA, into GAM1619 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22543] It is appreciated that GAM1619 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1619 target genes. The mRNA of each one of this plurality of GAM1619 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1619 RNA, herein designated GAM RNA, and which when bound by GAM1619 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1619 target proteins.

[22544] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1619 gene, herein designated GAM GENE, on one or more GAM1619 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22545] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1619 correlate with, and may be deduced from, the identity of the target genes which GAM1619 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22546] Nucleotide sequences of the GAM1619 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1619 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1619 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1619 are further described hereinbelow with reference to Table 1.

[22547] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1619 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22548] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1620 (GAM1620) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22549] GAM1620 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1620 was detected is described hereinabove with reference to Figs. 2-8.

[22550] GAM1620 gene, herein designated GAM GENE, and GAM1620 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22551] GAM1620 gene, herein designated GAM GENE, encodes a GAM1620 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1620 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1620 precursor RNA is designated SEQ ID:1597, and is provided hereinbelow with reference to the sequence listing part.

[22552] GAM1620 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22553] An enzyme complex designated DICER COMPLEX, dices the GAM1620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1620 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1620 RNA is designated SEQ ID:4203, and is provided hereinbelow with reference to the sequence listing part.

[22554] GAM1620 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1620 target RNA, herein designated GAM TARGET RNA. GAM1620 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22555] GAM1620 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1620 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1620 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1620 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1620 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22556] The complementary binding of GAM1620 RNA, herein designated GAM RNA, to target binding sites on GAM1620 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1620 target RNA, herein designated GAM TARGET RNA, into GAM1620 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22557] It is appreciated that GAM1620 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1620 target genes. The mRNA of each one of this plurality of GAM1620 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1620 RNA, herein designated GAM RNA, and which when bound by GAM1620 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1620 target proteins.

[22558] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1620 gene, herein designated GAM GENE, on one or more GAM1620 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22559] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1620 correlate with, and may be deduced from, the identity of the target genes which GAM1620 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22560] Nucleotide sequences of the GAM1620 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1620 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1620 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1620 are further described hereinbelow with reference to Table 1.

[22561] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1620 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[22562] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1621 (GAM1621) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22563] GAM1621 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1621 was detected is described hereinabove with reference to Figs. 2-8.

[22564] GAM1621 gene, herein designated GAM GENE, and GAM1621 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22565] GAM1621 gene, herein designated GAM GENE, encodes a GAM1621 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1621 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1621 precursor RNA is designated SEQ ID:1598, and is provided hereinbelow with reference to the sequence listing part.

[22566] GAM1621 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1621 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22567] An enzyme complex designated DICER COMPLEX, dices the GAM1621 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1621 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1621 RNA is designated SEQ ID:4202, and is provided hereinbelow with reference to the sequence listing part.

[22568] GAM1621 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1621 target RNA, herein designated GAM TARGET RNA. GAM1621 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22569] GAM1621 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1621 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1621 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1621 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1621 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22570] The complementary binding of GAM1621 RNA, herein designated GAM RNA, to target binding sites on GAM1621 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1621 target RNA, herein designated GAM TARGET RNA, into GAM1621 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22571] It is appreciated that GAM1621 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1621 target genes. The mRNA of each one of this plurality of GAM1621 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1621 RNA, herein designated GAM RNA, and which when bound by GAM1621 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1621 target proteins.

[22572] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1621 gene, herein designated GAM GENE, on one or more GAM1621 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22573] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1621 correlate with, and may be deduced from, the identity of the target genes which GAM1621 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22574] Nucleotide sequences of the GAM1621 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1621 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1621 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1621 are further described hereinbelow with reference to Table 1.

[22575] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1621 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22576] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1622 (GAM1622) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22577] GAM1622 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1622 was detected is described hereinabove with reference to Figs. 2-8.

[22578] GAM1622 gene, herein designated GAM GENE, and GAM1622 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22579] GAM1622 gene, herein designated GAM GENE, encodes a GAM1622 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1622 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1622 precursor RNA is designated SEQ ID:1599, and is provided hereinbelow with reference to the sequence listing part.

[22580] GAM1622 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22581] An enzyme complex designated DICER COMPLEX, dices the GAM1622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1622 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1622 RNA is designated SEQ ID:4204, and is provided hereinbelow with reference to the sequence listing part.

[22582] GAM1622 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1622 target RNA, herein designated GAM TARGET RNA. GAM1622 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22583] GAM1622 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1622 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1622 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1622 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1622 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22584] The complementary binding of GAM1622 RNA, herein designated GAM RNA, to target binding sites on GAM1622 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1622 target RNA, herein designated GAM TARGET RNA, into GAM1622 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22585] It is appreciated that GAM1622 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1622 target genes. The

mRNA of each one of this plurality of GAM1622 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1622 RNA, herein designated GAM RNA, and which when bound by GAM1622 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1622 target proteins.

[22586] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1622 gene, herein designated GAM GENE, on one or more GAM1622 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22587] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1622 correlate with, and may be deduced from, the identity of the target genes which GAM1622 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22588] Nucleotide sequences of the GAM1622 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1622 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1622 are further described hereinbelow with reference to Table 1.

[22589] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1622 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22590] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1623 (GAM1623) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22591] GAM1623 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1623 was detected is described hereinabove with reference to Figs. 2-8.

[22592] GAM1623 gene, herein designated GAM GENE, and GAM1623 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22593] GAM1623 gene, herein designated GAM GENE, encodes a GAM1623 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1623 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1623 precursor RNA is designated SEQ ID:1600, and is provided hereinbelow with reference to the sequence listing part.

[22594] GAM1623 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1623 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22595] An enzyme complex designated DICER COMPLEX, dices the GAM1623 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1623 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1623 RNA is designated SEQ ID:4205, and is provided hereinbelow with reference to the sequence listing part.

[22596] GAM1623 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1623 target RNA, herein designated GAM TARGET RNA. GAM1623 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22597] GAM1623 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1623 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1623 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1623 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1623 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22598] The complementary binding of GAM1623 RNA, herein designated GAM RNA, to target binding sites on GAM1623 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1623 target RNA, herein designated GAM TARGET RNA, into GAM1623 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22599] It is appreciated that GAM1623 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1623 target genes. The mRNA of each one of this plurality of GAM1623 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1623 RNA, herein designated GAM RNA, and which when bound by GAM1623 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1623 target proteins.

[22600] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1623 gene, herein designated GAM GENE, on one or more GAM1623 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22601] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1623 correlate with, and may be deduced from, the identity of the target

genes which GAM1623 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22602] Nucleotide sequences of the GAM1623 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1623 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1623 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1623 are further described hereinbelow with reference to Table 1.

[22603] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1623 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22604] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1624 (GAM1624) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22605] GAM1624 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1624 was detected is described hereinabove with reference to Figs. 2-8.

[22606] GAM1624 gene, herein designated GAM GENE, and GAM1624 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[22607] GAM1624 gene, herein designated GAM GENE, encodes a GAM1624 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1624 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1624 precursor RNA is designated SEQ ID:1601, and is provided hereinbelow with reference to the sequence listing part.

[22608] GAM1624 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1624 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22609] An enzyme complex designated DICER COMPLEX, dices the GAM1624 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1624 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1624 RNA is designated SEQ ID:4206, and is provided

hereinbelow with reference to the sequence listing part.

[22610] GAM1624 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1624 target RNA, herein designated GAM TARGET RNA. GAM1624 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22611] GAM1624 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1624 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1624 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1624 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1624 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22612] The complementary binding of GAM1624 RNA, herein designated GAM RNA, to target binding sites on GAM1624 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1624 target RNA, herein designated GAM TARGET RNA, into GAM1624 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22613] It is appreciated that GAM1624 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1624 target genes. The mRNA of each one of this plurality of GAM1624 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1624 RNA, herein designated GAM RNA, and which when bound by GAM1624 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1624 target proteins.

[22614] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1624 gene, herein designated GAM GENE, on one or more GAM1624 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22615] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1624 correlate with, and may be deduced from, the identity of the target genes which GAM1624 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22616] Nucleotide sequences of the GAM1624 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1624 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1624 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1624 are further described hereinbelow with reference to Table 1.

[22617] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1624 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22618] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1625 (GAM1625) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22619] GAM1625 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1625 was detected is described hereinabove with reference to Figs. 2-8.

[22620] GAM1625 gene, herein designated GAM GENE, and GAM1625 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22621] GAM1625 gene, herein designated GAM GENE, encodes a GAM1625 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1625 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1625 precursor RNA is designated SEQ ID:1602, and is provided hereinbelow with reference to the sequence listing part.

[22622] GAM1625 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1625 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22623] An enzyme complex designated DICER COMPLEX, dices the GAM1625 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1625 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1625 RNA is designated SEQ ID:4207, and is provided hereinbelow with reference to the sequence listing part.

[22624] GAM1625 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1625 target RNA, herein designated GAM TARGET RNA. GAM1625 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22625] GAM1625 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1625 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1625 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1625 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1625 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22626] The complementary binding of GAM1625 RNA, herein designated GAM RNA, to target binding sites on GAM1625 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1625 target RNA, herein designated GAM TARGET RNA, into GAM1625 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22627] It is appreciated that GAM1625 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1625 target genes. The mRNA of each one of this plurality of GAM1625 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1625 RNA, herein designated GAM RNA, and which when bound by GAM1625 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1625 target proteins.

[22628] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1625 gene, herein designated GAM GENE, on one or more GAM1625 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22629] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1625 correlate with, and may be deduced from, the identity of the target genes which GAM1625 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22630] Nucleotide sequences of the GAM1625 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1625 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1625 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1625 are further described hereinbelow with reference to Table 1.

[22631] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1625 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22632] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1626 (GAM1626) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22633] GAM1626 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1626 was detected is described hereinabove with reference to Figs. 2-8.

[22634] GAM1626 gene, herein designated GAM GENE, and GAM1626 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22635] GAM1626 gene, herein designated GAM GENE, encodes a GAM1626 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1626 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1626 precursor RNA is designated SEQ ID:1603, and is provided hereinbelow with reference to the sequence listing part.

[22636] GAM1626 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22637] An enzyme complex designated DICER COMPLEX, dices the GAM1626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1626 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM1626 RNA is designated SEQ ID:4208, and is provided hereinbelow with reference to the sequence listing part.

[22638] GAM1626 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1626 target RNA, herein designated GAM TARGET RNA. GAM1626 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22639] GAM1626 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1626 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1626 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1626 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1626 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22640] The complementary binding of GAM1626 RNA, herein designated GAM RNA, to target binding sites on GAM1626 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1626 target RNA, herein designated GAM TARGET RNA, into GAM1626 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22641] It is appreciated that GAM1626 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1626 target genes. The mRNA of each one of this plurality of GAM1626 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1626 RNA, herein designated GAM RNA, and which when bound by GAM1626 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1626 target proteins.

[22642] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1626 gene, herein designated GAM GENE, on one or more GAM1626 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22643] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1626 correlate with, and may be deduced from, the identity of the target genes which GAM1626 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22644] Nucleotide sequences of the GAM1626 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1626 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1626 are further described hereinbelow with reference to Table 1.

[22645] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1626 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[22646] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1627 (GAM1627) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22647] GAM1627 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1627 was detected is described hereinabove with reference to Figs. 2-8.

[22648] GAM1627 gene, herein designated GAM GENE, and GAM1627 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22649] GAM1627 gene, herein designated GAM GENE, encodes a GAM1627 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1627 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1627 precursor RNA is designated SEQ ID:1604, and is provided hereinbelow with reference to the sequence listing part.

[22650] GAM1627 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1627 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22651] An enzyme complex designated DICER COMPLEX, dices the GAM1627 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1627 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1627 RNA is designated SEQ ID:4209, and is provided hereinbelow with reference to the sequence listing part.

[22652] GAM1627 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1627 target RNA, herein designated GAM TARGET RNA. GAM1627 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22653] GAM1627 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1627 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1627 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1627 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1627 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22654] The complementary binding of GAM1627 RNA, herein designated GAM RNA, to target binding sites on GAM1627 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1627 target RNA, herein designated GAM TARGET RNA, into GAM1627 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22655] It is appreciated that GAM1627 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1627 target genes. The mRNA of each one of this plurality of GAM1627 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1627 RNA, herein designated GAM RNA, and which when bound by GAM1627 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1627 target proteins.

[22656] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1627 gene, herein designated GAM GENE, on one or more GAM1627 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22657] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1627 correlate with, and may be deduced from, the identity of the target genes which GAM1627 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22658] Nucleotide sequences of the GAM1627 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1627 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1627 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1627 are further described hereinbelow with reference to Table 1.

[22659] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1627 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22660] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1628 (GAM1628) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22661] GAM1628 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1628 was detected is described hereinabove with reference to Figs. 2-8.

[22662] GAM1628 gene, herein designated GAM GENE, and GAM1628 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22663] GAM1628 gene, herein designated GAM GENE, encodes a GAM1628 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1628 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1628 precursor RNA is designated SEQ ID:1605, and is provided hereinbelow with reference to the sequence listing part.

[22664] GAM1628 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22665] An enzyme complex designated DICER COMPLEX, dices the GAM1628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1628 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1628 RNA is designated SEQ ID:4210, and is provided hereinbelow with reference to the sequence listing part.

[22666] GAM1628 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1628 target RNA, herein designated GAM TARGET RNA. GAM1628 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22667] GAM1628 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1628 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1628 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1628 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1628 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22668] The complementary binding of GAM1628 RNA, herein designated GAM RNA, to target binding sites on GAM1628 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1628 target RNA, herein designated GAM TARGET RNA, into GAM1628 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22669] It is appreciated that GAM1628 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1628 target genes. The

mRNA of each one of this plurality of GAM1628 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1628 RNA, herein designated GAM RNA, and which when bound by GAM1628 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1628 target proteins.

[22670] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1628 gene, herein designated GAM GENE, on one or more GAM1628 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22671] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1628 correlate with, and may be deduced from, the identity of the target genes which GAM1628 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22672] Nucleotide sequences of the GAM1628 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1628 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1628 are further described hereinbelow with reference to Table 1.

[22673] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1628 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22674] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1629 (GAM1629) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22675] GAM1629 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1629 was detected is described hereinabove with reference to Figs. 2-8.

[22676] GAM1629 gene, herein designated GAM GENE, and GAM1629 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22677] GAM1629 gene, herein designated GAM GENE, encodes a GAM1629 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1629 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1629 precursor RNA is designated SEQ ID:1606, and is provided hereinbelow with reference to the sequence listing part.

[22678] GAM1629 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22679] An enzyme complex designated DICER COMPLEX, dices the GAM1629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1629 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1629 RNA is designated SEQ ID:4211, and is provided hereinbelow with reference to the sequence listing part.

[22680] GAM1629 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1629 target RNA, herein designated GAM TARGET RNA. GAM1629 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22681] GAM1629 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1629 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1629 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1629 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1629 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22682] The complementary binding of GAM1629 RNA, herein designated GAM RNA, to target binding sites on GAM1629 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1629 target RNA, herein designated GAM TARGET RNA, into GAM1629 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22683] It is appreciated that GAM1629 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1629 target genes. The mRNA of each one of this plurality of GAM1629 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1629 RNA, herein designated GAM RNA, and which when bound by GAM1629 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1629 target proteins.

[22684] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1629 gene, herein designated GAM GENE, on one or more GAM1629 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22685] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1629 correlate with, and may be deduced from, the identity of the target

genes which GAM1629 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22686] Nucleotide sequences of the GAM1629 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1629 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1629 are further described hereinbelow with reference to Table 1.

[22687] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1629 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22688] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1630 (GAM1630) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22689] GAM1630 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1630 was detected is described hereinabove with reference to Figs. 2-8.

[22690] GAM1630 gene, herein designated GAM GENE, and GAM1630 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[22691] GAM1630 gene, herein designated GAM GENE, encodes a GAM1630 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1630 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1630 precursor RNA is designated SEQ ID:1607, and is provided hereinbelow with reference to the sequence listing part.

[22692] GAM1630 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22693] An enzyme complex designated DICER COMPLEX, dices the GAM1630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1630 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1630 RNA is designated SEQ ID:4212, and is provided

hereinbelow with reference to the sequence listing part.

[22694] GAM1630 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1630 target RNA, herein designated GAM TARGET RNA. GAM1630 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22695] GAM1630 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1630 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1630 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1630 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1630 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22696] The complementary binding of GAM1630 RNA, herein designated GAM RNA, to target binding sites on GAM1630 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1630 target RNA, herein designated GAM TARGET RNA, into GAM1630 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22697] It is appreciated that GAM1630 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1630 target genes. The mRNA of each one of this plurality of GAM1630 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1630 RNA, herein designated GAM RNA, and which when bound by GAM1630 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1630 target proteins.

[22698] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1630 gene, herein designated GAM GENE, on one or more GAM1630 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22699] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1630 correlate with, and may be deduced from, the identity of the target genes which GAM1630 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22700] Nucleotide sequences of the GAM1630 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1630 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1630 are further described hereinbelow with reference to Table 1.

[22701] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1630 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22702] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1631 (GAM1631) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22703] GAM1631 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1631 was detected is described hereinabove with reference to Figs. 2-8.

[22704] GAM1631 gene, herein designated GAM GENE, and GAM1631 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22705] GAM1631 gene, herein designated GAM GENE, encodes a GAM1631 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1631 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1631 precursor RNA is designated SEQ ID:1608, and is provided hereinbelow with reference to the sequence listing part.

[22706] GAM1631 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22707] An enzyme complex designated DICER COMPLEX, dices the GAM1631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1631 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1631 RNA is designated SEQ ID:4213, and is provided hereinbelow with reference to the sequence listing part.

[22708] GAM1631 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1631 target RNA, herein designated GAM TARGET RNA. GAM1631 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22709] GAM1631 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1631 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1631 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1631 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1631 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22710] The complementary binding of GAM1631 RNA, herein designated GAM RNA, to target binding sites on GAM1631 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1631 target RNA, herein designated GAM TARGET RNA, into GAM1631 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22711] It is appreciated that GAM1631 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1631 target genes. The mRNA of each one of this plurality of GAM1631 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1631 RNA, herein designated GAM RNA, and which when bound by GAM1631 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1631 target proteins.

[22712] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1631 gene, herein designated GAM GENE, on one or more GAM1631 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22713] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1631 correlate with, and may be deduced from, the identity of the target genes which GAM1631 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22714] Nucleotide sequences of the GAM1631 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1631 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1631 are further described hereinbelow with reference to Table 1.

[22715] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1631 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22716] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1632 (GAM1632) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22717] GAM1632 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1632 was detected is described hereinabove with reference to Figs. 2-8.

[22718] GAM1632 gene, herein designated GAM GENE, and GAM1632 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22719] GAM1632 gene, herein designated GAM GENE, encodes a GAM1632 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1632 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1632 precursor RNA is designated SEQ ID:1609, and is provided hereinbelow with reference to the sequence listing part.

[22720] GAM1632 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22721] An enzyme complex designated DICER COMPLEX, dices the GAM1632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1632 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1632 RNA is designated SEQ ID:4214, and is provided hereinbelow with reference to the sequence listing part.

[22722] GAM1632 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1632 target RNA, herein designated GAM TARGET RNA. GAM1632 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22723] GAM1632 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1632 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1632 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1632 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1632 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22724] The complementary binding of GAM1632 RNA, herein designated GAM RNA, to target binding sites on GAM1632 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1632 target RNA, herein designated GAM TARGET RNA, into GAM1632 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22725] It is appreciated that GAM1632 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1632 target genes. The mRNA of each one of this plurality of GAM1632 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1632 RNA, herein designated GAM RNA, and which when bound by GAM1632 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1632 target proteins.

[22726] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1632 gene, herein designated GAM GENE, on one or more GAM1632 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22727] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1632 correlate with, and may be deduced from, the identity of the target genes which GAM1632 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22728] Nucleotide sequences of the GAM1632 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1632 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1632 are further described hereinbelow with reference to Table 1.

[22729] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1632 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[22730] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1633 (GAM1633) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22731] GAM1633 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1633 was detected is described hereinabove with reference to Figs. 2-8.

[22732] GAM1633 gene, herein designated GAM GENE, and GAM1633 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22733] GAM1633 gene, herein designated GAM GENE, encodes a GAM1633 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1633 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1633 precursor RNA is designated SEQ ID:1610, and is provided hereinbelow with reference to the sequence listing part.

[22734] GAM1633 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22735] An enzyme complex designated DICER COMPLEX, dices the GAM1633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1633 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1633 RNA is designated SEQ ID:4215, and is provided hereinbelow with reference to the sequence listing part.

[22736] GAM1633 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1633 target RNA, herein designated GAM TARGET RNA. GAM1633 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22737] GAM1633 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1633 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1633 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1633 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1633 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22738] The complementary binding of GAM1633 RNA, herein designated GAM RNA, to target binding sites on GAM1633 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1633 target RNA, herein designated GAM TARGET RNA, into GAM1633 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22739] It is appreciated that GAM1633 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1633 target genes. The mRNA of each one of this plurality of GAM1633 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1633 RNA, herein designated GAM RNA, and which when bound by GAM1633 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1633 target proteins.

[22740] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1633 gene, herein designated GAM GENE, on one or more GAM1633 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22741] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1633 correlate with, and may be deduced from, the identity of the target genes which GAM1633 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22742] Nucleotide sequences of the GAM1633 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1633 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1633 are further described hereinbelow with reference to Table 1.

[22743] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1633 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22744] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1634 (GAM1634) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22745] GAM1634 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1634 was detected is described hereinabove with reference to Figs. 2-8.

[22746] GAM1634 gene, herein designated GAM GENE, and GAM1634 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22747] GAM1634 gene, herein designated GAM GENE, encodes a GAM1634 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1634 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1634 precursor RNA is designated SEQ ID:1611, and is provided hereinbelow with reference to the sequence listing part.

[22748] GAM1634 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1634 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22749] An enzyme complex designated DICER COMPLEX, dices the GAM1634 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1634 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM1634 RNA is designated SEQ ID:4216, and is provided hereinbelow with reference to the sequence listing part.

[22750] GAM1634 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1634 target RNA, herein designated GAM TARGET RNA. GAM1634 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22751] GAM1634 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1634 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1634 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1634 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1634 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22752] The complementary binding of GAM1634 RNA, herein designated GAM RNA, to target binding sites on GAM1634 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1634 target RNA, herein designated GAM TARGET RNA, into GAM1634 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22753] It is appreciated that GAM1634 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1634 target genes. The

mRNA of each one of this plurality of GAM1634 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1634 RNA, herein designated GAM RNA, and which when bound by GAM1634 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1634 target proteins.

[22754] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1634 gene, herein designated GAM GENE, on one or more GAM1634 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22755] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1634 correlate with, and may be deduced from, the identity of the target genes which GAM1634 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22756] Nucleotide sequences of the GAM1634 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1634 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1634 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1634 are further described hereinbelow with reference to Table 1.

[22757] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1634 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22758] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1635 (GAM1635) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22759] GAM1635 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1635 was detected is described hereinabove with reference to Figs. 2-8.

[22760] GAM1635 gene, herein designated GAM GENE, and GAM1635 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22761] GAM1635 gene, herein designated GAM GENE, encodes a GAM1635 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1635 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1635 precursor RNA is designated SEQ ID:1612, and is provided hereinbelow with reference to the sequence listing part.

[22762] GAM1635 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1635 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22763] An enzyme complex designated DICER COMPLEX, dices the GAM1635 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1635 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1635 RNA is designated SEQ ID:4217, and is provided hereinbelow with reference to the sequence listing part.

[22764] GAM1635 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1635 target RNA, herein designated GAM TARGET RNA. GAM1635 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22765] GAM1635 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1635 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1635 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1635 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1635 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22766] The complementary binding of GAM1635 RNA, herein designated GAM RNA, to target binding sites on GAM1635 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1635 target RNA, herein designated GAM TARGET RNA, into GAM1635 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22767] It is appreciated that GAM1635 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1635 target genes. The mRNA of each one of this plurality of GAM1635 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1635 RNA, herein designated GAM RNA, and which when bound by GAM1635 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1635 target proteins.

[22768] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1635 gene, herein designated GAM GENE, on one or more GAM1635 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22769] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1635 correlate with, and may be deduced from, the identity of the target

genes which GAM1635 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22770] Nucleotide sequences of the GAM1635 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1635 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1635 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1635 are further described hereinbelow with reference to Table 1.

[22771] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1635 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22772] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1636 (GAM1636) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22773] GAM1636 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1636 was detected is described hereinabove with reference to Figs. 2-8.

[22774] GAM1636 gene, herein designated GAM GENE, and GAM1636 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[22775] GAM1636 gene, herein designated GAM GENE, encodes a GAM1636 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1636 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1636 precursor RNA is designated SEQ ID:1613, and is provided hereinbelow with reference to the sequence listing part.

[22776] GAM1636 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22777] An enzyme complex designated DICER COMPLEX, dices the GAM1636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1636 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1636 RNA is designated SEQ ID:4218, and is provided

hereinbelow with reference to the sequence listing part.

[22778] GAM1636 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1636 target RNA, herein designated GAM TARGET RNA. GAM1636 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22779] GAM1636 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1636 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1636 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1636 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1636 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22780] The complementary binding of GAM1636 RNA, herein designated GAM RNA, to target binding sites on GAM1636 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1636 target RNA, herein designated GAM TARGET RNA, into GAM1636 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22781] It is appreciated that GAM1636 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1636 target genes. The mRNA of each one of this plurality of GAM1636 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1636 RNA, herein designated GAM RNA, and which when bound by GAM1636 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1636 target proteins.

[22782] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1636 gene, herein designated GAM GENE, on one or more GAM1636 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22783] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1636 correlate with, and may be deduced from, the identity of the target genes which GAM1636 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22784] Nucleotide sequences of the GAM1636 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1636 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1636 are further described hereinbelow with reference to Table 1.

[22785] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1636 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22786] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1637 (GAM1637) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22787] GAM1637 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1637 was detected is described hereinabove with reference to Figs. 2-8.

[22788] GAM1637 gene, herein designated GAM GENE, and GAM1637 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22789] GAM1637 gene, herein designated GAM GENE, encodes a GAM1637 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1637 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1637 precursor RNA is designated SEQ ID:1614, and is provided hereinbelow with reference to the sequence listing part.

[22790] GAM1637 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1637 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22791] An enzyme complex designated DICER COMPLEX, dices the GAM1637 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1637 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1637 RNA is designated SEQ ID:4219, and is provided hereinbelow with reference to the sequence listing part.

[22792] GAM1637 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1637 target RNA, herein designated GAM TARGET RNA. GAM1637 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22793] GAM1637 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1637 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1637 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1637 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1637 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22794] The complementary binding of GAM1637 RNA, herein designated GAM RNA, to target binding sites on GAM1637 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1637 target RNA, herein designated GAM TARGET RNA, into GAM1637 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22795] It is appreciated that GAM1637 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1637 target genes. The mRNA of each one of this plurality of GAM1637 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1637 RNA, herein designated GAM RNA, and which when bound by GAM1637 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1637 target proteins.

[22796] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1637 gene, herein designated GAM GENE, on one or more GAM1637 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22797] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1637 correlate with, and may be deduced from, the identity of the target genes which GAM1637 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22798] Nucleotide sequences of the GAM1637 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1637 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1637 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1637 are further described hereinbelow with reference to Table 1.

[22799] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1637 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22800] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1638 (GAM1638) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22801] GAM1638 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1638 was detected is described hereinabove with reference to Figs. 2-8.

[22802] GAM1638 gene, herein designated GAM GENE, and GAM1638 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22803] GAM1638 gene, herein designated GAM GENE, encodes a GAM1638 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1638 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1638 precursor RNA is designated SEQ ID:1615, and is provided hereinbelow with reference to the sequence listing part.

[22804] GAM1638 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22805] An enzyme complex designated DICER COMPLEX, dices the GAM1638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1638 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1638 RNA is designated SEQ ID:4220, and is provided hereinbelow with reference to the sequence listing part.

[22806] GAM1638 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1638 target RNA, herein designated GAM TARGET RNA. GAM1638 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22807] GAM1638 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1638 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1638 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1638 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1638 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22808] The complementary binding of GAM1638 RNA, herein designated GAM RNA, to target binding sites on GAM1638 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1638 target RNA, herein designated GAM TARGET RNA, into GAM1638 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22809] It is appreciated that GAM1638 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1638 target genes. The mRNA of each one of this plurality of GAM1638 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1638 RNA, herein designated GAM RNA, and which when bound by GAM1638 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1638 target proteins.

[22810] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1638 gene, herein designated GAM GENE, on one or more GAM1638 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22811] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1638 correlate with, and may be deduced from, the identity of the target genes which GAM1638 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22812] Nucleotide sequences of the GAM1638 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1638 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1638 are further described hereinbelow with reference to Table 1.

[22813] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1638 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[22814] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1639 (GAM1639) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22815] GAM1639 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1639 was detected is described hereinabove with reference to Figs. 2-8.

[22816] GAM1639 gene, herein designated GAM GENE, and GAM1639 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22817] GAM1639 gene, herein designated GAM GENE, encodes a GAM1639 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1639 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1639 precursor RNA is designated SEQ ID:1616, and is provided hereinbelow with reference to the sequence listing part.

[22818] GAM1639 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1639 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22819] An enzyme complex designated DICER COMPLEX, dices the GAM1639 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1639 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1639 RNA is designated SEQ ID:4221, and is provided hereinbelow with reference to the sequence listing part.

[22820] GAM1639 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1639 target RNA, herein designated GAM TARGET RNA. GAM1639 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22821] GAM1639 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1639 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1639 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1639 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1639 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22822] The complementary binding of GAM1639 RNA, herein designated GAM RNA, to target binding sites on GAM1639 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1639 target RNA, herein designated GAM TARGET RNA, into GAM1639 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22823] It is appreciated that GAM1639 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1639 target genes. The mRNA of each one of this plurality of GAM1639 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1639 RNA, herein designated GAM RNA, and which when bound by GAM1639 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1639 target proteins.

[22824] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1639 gene, herein designated GAM GENE, on one or more GAM1639 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22825] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1639 correlate with, and may be deduced from, the identity of the target genes which GAM1639 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22826] Nucleotide sequences of the GAM1639 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1639 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1639 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1639 are further described hereinbelow with reference to Table 1.

[22827] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1639 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22828] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1640 (GAM1640) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22829] GAM1640 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1640 was detected is described hereinabove with reference to Figs. 2-8.

[22830] GAM1640 gene, herein designated GAM GENE, and GAM1640 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22831] GAM1640 gene, herein designated GAM GENE, encodes a GAM1640 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1640 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1640 precursor RNA is designated SEQ ID:1617, and is provided hereinbelow with reference to the sequence listing part.

[22832] GAM1640 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1640 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22833] An enzyme complex designated DICER COMPLEX, dices the GAM1640 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1640 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1640 RNA is designated SEQ ID:4222, and is provided hereinbelow with reference to the sequence listing part.

[22834] GAM1640 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1640 target RNA, herein designated GAM TARGET RNA. GAM1640 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22835] GAM1640 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1640 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1640 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1640 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1640 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22836] The complementary binding of GAM1640 RNA, herein designated GAM RNA, to target binding sites on GAM1640 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1640 target RNA, herein designated GAM TARGET RNA, into GAM1640 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22837] It is appreciated that GAM1640 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1640 target genes. The

mRNA of each one of this plurality of GAM1640 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1640 RNA, herein designated GAM RNA, and which when bound by GAM1640 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1640 target proteins.

[22838] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1640 gene, herein designated GAM GENE, on one or more GAM1640 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22839] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1640 correlate with, and may be deduced from, the identity of the target genes which GAM1640 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22840] Nucleotide sequences of the GAM1640 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1640 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1640 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1640 are further described hereinbelow with reference to Table 1.

[22841] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1640 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22842] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1641 (GAM1641) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22843] GAM1641 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1641 was detected is described hereinabove with reference to Figs. 2-8.

[22844] GAM1641 gene, herein designated GAM GENE, and GAM1641 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22845] GAM1641 gene, herein designated GAM GENE, encodes a GAM1641 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1641 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1641 precursor RNA is designated SEQ ID:1618, and is provided hereinbelow with reference to the sequence listing part.

[22846] GAM1641 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1641 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22847] An enzyme complex designated DICER COMPLEX, dices the GAM1641 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1641 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1641 RNA is designated SEQ ID:4223, and is provided hereinbelow with reference to the sequence listing part.

[22848] GAM1641 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1641 target RNA, herein designated GAM TARGET RNA. GAM1641 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22849] GAM1641 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1641 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1641 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1641 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1641 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22850] The complementary binding of GAM1641 RNA, herein designated GAM RNA, to target binding sites on GAM1641 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1641 target RNA, herein designated GAM TARGET RNA, into GAM1641 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22851] It is appreciated that GAM1641 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1641 target genes. The mRNA of each one of this plurality of GAM1641 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1641 RNA, herein designated GAM RNA, and which when bound by GAM1641 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1641 target proteins.

[22852] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1641 gene, herein designated GAM GENE, on one or more GAM1641 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22853] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1641 correlate with, and may be deduced from, the identity of the target

genes which GAM1641 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22854] Nucleotide sequences of the GAM1641 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1641 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1641 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1641 are further described hereinbelow with reference to Table 1.

[22855] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1641 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22856] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1642 (GAM1642) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22857] GAM1642 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1642 was detected is described hereinabove with reference to Figs. 2-8.

[22858] GAM1642 gene, herein designated GAM GENE, and GAM1642 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[22859] GAM1642 gene, herein designated GAM GENE, encodes a GAM1642 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1642 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1642 precursor RNA is designated SEQ ID:1619, and is provided hereinbelow with reference to the sequence listing part.

[22860] GAM1642 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1642 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22861] An enzyme complex designated DICER COMPLEX, dices the GAM1642 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1642 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM1642 RNA is designated SEQ ID:4224, and is provided

hereinbelow with reference to the sequence listing part.

[22862] GAM1642 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1642 target RNA, herein designated GAM TARGET RNA. GAM1642 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22863] GAM1642 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1642 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1642 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1642 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1642 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22864] The complementary binding of GAM1642 RNA, herein designated GAM RNA, to target binding sites on GAM1642 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1642 target RNA, herein designated GAM TARGET RNA, into GAM1642 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22865] It is appreciated that GAM1642 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1642 target genes. The mRNA of each one of this plurality of GAM1642 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1642 RNA, herein designated GAM RNA, and which when bound by GAM1642 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1642 target proteins.

[22866] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1642 gene, herein designated GAM GENE, on one or more GAM1642 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22867] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1642 correlate with, and may be deduced from, the identity of the target genes which GAM1642 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22868] Nucleotide sequences of the GAM1642 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1642 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1642 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1642 are further described hereinbelow with reference to Table 1.

[22869] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1642 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22870] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1643 (GAM1643) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22871] GAM1643 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1643 was detected is described hereinabove with reference to Figs. 2-8.

[22872] GAM1643 gene, herein designated GAM GENE, and GAM1643 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22873] GAM1643 gene, herein designated GAM GENE, encodes a GAM1643 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1643 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1643 precursor RNA is designated SEQ ID:1620, and is provided hereinbelow with reference to the sequence listing part.

[22874] GAM1643 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1643 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22875] An enzyme complex designated DICER COMPLEX, dices the GAM1643 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1643 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1643 RNA is designated SEQ ID:4225, and is provided hereinbelow with reference to the sequence listing part.

[22876] GAM1643 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1643 target RNA, herein designated GAM TARGET RNA. GAM1643 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22877] GAM1643 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1643 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1643 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1643 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1643 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22878] The complementary binding of GAM1643 RNA, herein designated GAM RNA, to target binding sites on GAM1643 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1643 target RNA, herein designated GAM TARGET RNA, into GAM1643 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22879] It is appreciated that GAM1643 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1643 target genes. The mRNA of each one of this plurality of GAM1643 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1643 RNA, herein designated GAM RNA, and which when bound by GAM1643 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1643 target proteins.

[22880] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1643 gene, herein designated GAM GENE, on one or more GAM1643 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22881] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1643 correlate with, and may be deduced from, the identity of the target genes which GAM1643 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22882] Nucleotide sequences of the GAM1643 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1643 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1643 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1643 are further described hereinbelow with reference to Table 1.

[22883] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1643 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22884] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1644 (GAM1644) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22885] GAM1644 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1644 was detected is described hereinabove with reference to Figs. 2-8.

[22886] GAM1644 gene, herein designated GAM GENE, and GAM1644 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22887] GAM1644 gene, herein designated GAM GENE, encodes a GAM1644 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1644 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1644 precursor RNA is designated SEQ ID:1621, and is provided hereinbelow with reference to the sequence listing part.

[22888] GAM1644 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1644 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22889] An enzyme complex designated DICER COMPLEX, dices the GAM1644 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1644 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1644 RNA is designated SEQ ID:4226, and is provided hereinbelow with reference to the sequence listing part.

[22890] GAM1644 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1644 target RNA, herein designated GAM TARGET RNA. GAM1644 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22891] GAM1644 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1644 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1644 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1644 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1644 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22892] The complementary binding of GAM1644 RNA, herein designated GAM RNA, to target binding sites on GAM1644 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1644 target RNA, herein designated GAM TARGET RNA, into GAM1644 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22893] It is appreciated that GAM1644 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1644 target genes. The mRNA of each one of this plurality of GAM1644 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1644 RNA, herein designated GAM RNA, and which when bound by GAM1644 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1644 target proteins.

[22894] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1644 gene, herein designated GAM GENE, on one or more GAM1644 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22895] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1644 correlate with, and may be deduced from, the identity of the target genes which GAM1644 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22896] Nucleotide sequences of the GAM1644 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1644 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1644 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1644 are further described hereinbelow with reference to Table 1.

[22897] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1644 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[22898] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1645 (GAM1645) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22899] GAM1645 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1645 was detected is described hereinabove with reference to Figs. 2-8.

[22900] GAM1645 gene, herein designated GAM GENE, and GAM1645 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22901] GAM1645 gene, herein designated GAM GENE, encodes a GAM1645 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1645 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1645 precursor RNA is designated SEQ ID:1622, and is provided hereinbelow with reference to the sequence listing part.

[22902] GAM1645 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1645 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22903] An enzyme complex designated DICER COMPLEX, dices the GAM1645 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1645 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1645 RNA is designated SEQ ID:4227, and is provided hereinbelow with reference to the sequence listing part.

[22904] GAM1645 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1645 target RNA, herein designated GAM TARGET RNA. GAM1645 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22905] GAM1645 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1645 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1645 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1645 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1645 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22906] The complementary binding of GAM1645 RNA, herein designated GAM RNA, to target binding sites on GAM1645 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1645 target RNA, herein designated GAM TARGET RNA, into GAM1645 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22907] It is appreciated that GAM1645 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1645 target genes. The mRNA of each one of this plurality of GAM1645 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1645 RNA, herein designated GAM RNA, and which when bound by GAM1645 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1645 target proteins.

[22908] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1645 gene, herein designated GAM GENE, on one or more GAM1645 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22909] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1645 correlate with, and may be deduced from, the identity of the target genes which GAM1645 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22910] Nucleotide sequences of the GAM1645 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1645 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1645 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1645 are further described hereinbelow with reference to Table 1.

[22911] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1645 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22912] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1646 (GAM1646) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22913] GAM1646 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1646 was detected is described hereinabove with reference to Figs. 2-8.

[22914] GAM1646 gene, herein designated GAM GENE, and GAM1646 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22915] GAM1646 gene, herein designated GAM GENE, encodes a GAM1646 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1646 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1646 precursor RNA is designated SEQ ID:1623, and is provided hereinbelow with reference to the sequence listing part.

[22916] GAM1646 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1646 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22917] An enzyme complex designated DICER COMPLEX, dices the GAM1646 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1646 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1646 RNA is designated SEQ ID:4228, and is provided hereinbelow with reference to the sequence listing part.

[22918] GAM1646 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1646 target RNA, herein designated GAM TARGET RNA. GAM1646 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22919] GAM1646 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1646 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1646 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1646 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1646 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22920] The complementary binding of GAM1646 RNA, herein designated GAM RNA, to target binding sites on GAM1646 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1646 target RNA, herein designated GAM TARGET RNA, into GAM1646 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22921] It is appreciated that GAM1646 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1646 target genes. The

mRNA of each one of this plurality of GAM1646 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1646 RNA, herein designated GAM RNA, and which when bound by GAM1646 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1646 target proteins.

[22922] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1646 gene, herein designated GAM GENE, on one or more GAM1646 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22923] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1646 correlate with, and may be deduced from, the identity of the target genes which GAM1646 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22924] Nucleotide sequences of the GAM1646 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1646 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1646 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1646 are further described hereinbelow with reference to Table 1.

[22925] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1646 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22926] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1647 (GAM1647) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22927] GAM1647 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1647 was detected is described hereinabove with reference to Figs. 2-8.

[22928] GAM1647 gene, herein designated GAM GENE, and GAM1647 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22929] GAM1647 gene, herein designated GAM GENE, encodes a GAM1647 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1647 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1647 precursor RNA is designated SEQ ID:1624, and is provided hereinbelow with reference to the sequence listing part.

[22930] GAM1647 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1647 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22931] An enzyme complex designated DICER COMPLEX, dices the GAM1647 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1647 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1647 RNA is designated SEQ ID:4229, and is provided hereinbelow with reference to the sequence listing part.

[22932] GAM1647 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1647 target RNA, herein designated GAM TARGET RNA. GAM1647 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22933] GAM1647 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1647 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1647 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1647 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1647 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22934] The complementary binding of GAM1647 RNA, herein designated GAM RNA, to target binding sites on GAM1647 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1647 target RNA, herein designated GAM TARGET RNA, into GAM1647 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22935] It is appreciated that GAM1647 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1647 target genes. The mRNA of each one of this plurality of GAM1647 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1647 RNA, herein designated GAM RNA, and which when bound by GAM1647 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1647 target proteins.

[22936] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1647 gene, herein designated GAM GENE, on one or more GAM1647 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22937] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1647 correlate with, and may be deduced from, the identity of the target

genes which GAM1647 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22938] Nucleotide sequences of the GAM1647 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1647 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1647 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1647 are further described hereinbelow with reference to Table 1.

[22939] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1647 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22940] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1648 (GAM1648) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22941] GAM1648 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1648 was detected is described hereinabove with reference to Figs. 2-8.

[22942] GAM1648 gene, herein designated GAM GENE, and GAM1648 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[22943] GAM1648 gene, herein designated GAM GENE, encodes a GAM1648 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1648 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1648 precursor RNA is designated SEQ ID:1625, and is provided hereinbelow with reference to the sequence listing part.

[22944] GAM1648 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1648 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22945] An enzyme complex designated DICER COMPLEX, dices the GAM1648 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1648 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1648 RNA is designated SEQ ID:4230, and is provided

hereinbelow with reference to the sequence listing part.

[22946] GAM1648 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1648 target RNA, herein designated GAM TARGET RNA. GAM1648 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22947] GAM1648 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1648 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1648 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1648 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1648 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22948] The complementary binding of GAM1648 RNA, herein designated GAM RNA, to target binding sites on GAM1648 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1648 target RNA, herein designated GAM TARGET RNA, into GAM1648 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22949] It is appreciated that GAM1648 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1648 target genes. The mRNA of each one of this plurality of GAM1648 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1648 RNA, herein designated GAM RNA, and which when bound by GAM1648 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1648 target proteins.

[22950] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1648 gene, herein designated GAM GENE, on one or more GAM1648 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22951] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1648 correlate with, and may be deduced from, the identity of the target genes which GAM1648 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22952] Nucleotide sequences of the GAM1648 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1648 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1648 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1648 are further described hereinbelow with reference to Table 1.

[22953] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1648 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22954] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1649 (GAM1649) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22955] GAM1649 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1649 was detected is described hereinabove with reference to Figs. 2-8.

[22956] GAM1649 gene, herein designated GAM GENE, and GAM1649 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22957] GAM1649 gene, herein designated GAM GENE, encodes a GAM1649 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1649 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1649 precursor RNA is designated SEQ ID:1626, and is provided hereinbelow with reference to the sequence listing part.

[22958] GAM1649 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1649 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22959] An enzyme complex designated DICER COMPLEX, dices the GAM1649 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1649 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1649 RNA is designated SEQ ID:4231, and is provided hereinbelow with reference to the sequence listing part.

[22960] GAM1649 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1649 target RNA, herein designated GAM TARGET RNA. GAM1649 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22961] GAM1649 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1649 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1649 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1649 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1649 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22962] The complementary binding of GAM1649 RNA, herein designated GAM RNA, to target binding sites on GAM1649 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1649 target RNA, herein designated GAM TARGET RNA, into GAM1649 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22963] It is appreciated that GAM1649 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1649 target genes. The mRNA of each one of this plurality of GAM1649 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1649 RNA, herein designated GAM RNA, and which when bound by GAM1649 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1649 target proteins.

[22964] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1649 gene, herein designated GAM GENE, on one or more GAM1649 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22965] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1649 correlate with, and may be deduced from, the identity of the target genes which GAM1649 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22966] Nucleotide sequences of the GAM1649 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1649 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1649 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1649 are further described hereinbelow with reference to Table 1.

[22967] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1649 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22968] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1650 (GAM1650) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22969] GAM1650 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1650 was detected is described hereinabove with reference to Figs. 2-8.

[22970] GAM1650 gene, herein designated GAM GENE, and GAM1650 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22971] GAM1650 gene, herein designated GAM GENE, encodes a GAM1650 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1650 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1650 precursor RNA is designated SEQ ID:1627, and is provided hereinbelow with reference to the sequence listing part.

[22972] GAM1650 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1650 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22973] An enzyme complex designated DICER COMPLEX, dices the GAM1650 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1650 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1650 RNA is designated SEQ ID:4234, and is provided hereinbelow with reference to the sequence listing part.

[22974] GAM1650 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1650 target RNA, herein designated GAM TARGET RNA. GAM1650 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22975] GAM1650 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1650 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1650 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1650 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1650 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22976] The complementary binding of GAM1650 RNA, herein designated GAM RNA, to target binding sites on GAM1650 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1650 target RNA, herein designated GAM TARGET RNA, into GAM1650 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22977] It is appreciated that GAM1650 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1650 target genes. The mRNA of each one of this plurality of GAM1650 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1650 RNA, herein designated GAM RNA, and which when bound by GAM1650 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1650 target proteins.

[22978] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1650 gene, herein designated GAM GENE, on one or more GAM1650 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22979] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1650 correlate with, and may be deduced from, the identity of the target genes which GAM1650 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22980] Nucleotide sequences of the GAM1650 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1650 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1650 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1650 are further described hereinbelow with reference to Table 1.

[22981] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1650 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[22982] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1651 (GAM1651) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22983] GAM1651 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1651 was detected is described hereinabove with reference to Figs. 2-8.

[22984] GAM1651 gene, herein designated GAM GENE, and GAM1651 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22985] GAM1651 gene, herein designated GAM GENE, encodes a GAM1651 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1651 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1651 precursor RNA is designated SEQ ID:1628, and is provided hereinbelow with reference to the sequence listing part.

[22986] GAM1651 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1651 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22987] An enzyme complex designated DICER COMPLEX, dices the GAM1651 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1651 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1651 RNA is designated SEQ ID:4232, and is provided hereinbelow with reference to the sequence listing part.

[22988] GAM1651 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1651 target RNA, herein designated GAM TARGET RNA. GAM1651 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[22989] GAM1651 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1651 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1651 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1651 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1651 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[22990] The complementary binding of GAM1651 RNA, herein designated GAM RNA, to target binding sites on GAM1651 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1651 target RNA, herein designated GAM TARGET RNA, into GAM1651 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[22991] It is appreciated that GAM1651 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1651 target genes. The mRNA of each one of this plurality of GAM1651 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1651 RNA, herein designated GAM RNA, and which when bound by GAM1651 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1651 target proteins.

[22992] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1651 gene, herein designated GAM GENE, on one or more GAM1651 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[22993] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1651 correlate with, and may be deduced from, the identity of the target genes which GAM1651 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22994] Nucleotide sequences of the GAM1651 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1651 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1651 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1651 are further described hereinbelow with reference to Table 1.

[22995] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1651 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[22996] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1652 (GAM1652) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[22997] GAM1652 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1652 was detected is described hereinabove with reference to Figs. 2-8.

[22998] GAM1652 gene, herein designated GAM GENE, and GAM1652 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[22999] GAM1652 gene, herein designated GAM GENE, encodes a GAM1652 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1652 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1652 precursor RNA is designated SEQ ID:1629, and is provided hereinbelow with reference to the sequence listing part.

[23000] GAM1652 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1652 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23001] An enzyme complex designated DICER COMPLEX, dices the GAM1652 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1652 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1652 RNA is designated SEQ ID:4233, and is provided hereinbelow with reference to the sequence listing part.

[23002] GAM1652 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1652 target RNA, herein designated GAM TARGET RNA. GAM1652 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23003] GAM1652 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1652 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1652 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1652 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1652 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23004] The complementary binding of GAM1652 RNA, herein designated GAM RNA, to target binding sites on GAM1652 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1652 target RNA, herein designated GAM TARGET RNA, into GAM1652 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23005] It is appreciated that GAM1652 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1652 target genes. The

mRNA of each one of this plurality of GAM1652 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1652 RNA, herein designated GAM RNA, and which when bound by GAM1652 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1652 target proteins.

[23006] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1652 gene, herein designated GAM GENE, on one or more GAM1652 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23007] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1652 correlate with, and may be deduced from, the identity of the target genes which GAM1652 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23008] Nucleotide sequences of the GAM1652 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1652 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1652 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1652 are further described hereinbelow with reference to Table 1.

[23009] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1652 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23010] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1653 (GAM1653) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23011] GAM1653 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1653 was detected is described hereinabove with reference to Figs. 2-8.

[23012] GAM1653 gene, herein designated GAM GENE, and GAM1653 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23013] GAM1653 gene, herein designated GAM GENE, encodes a GAM1653 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1653 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1653 precursor RNA is designated SEQ ID:1630, and is provided hereinbelow with reference to the sequence listing part.

[23014] GAM1653 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1653 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23015] An enzyme complex designated DICER COMPLEX, dices the GAM1653 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1653 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1653 RNA is designated SEQ ID:4235, and is provided hereinbelow with reference to the sequence listing part.

[23016] GAM1653 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1653 target RNA, herein designated GAM TARGET RNA. GAM1653 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23017] GAM1653 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1653 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1653 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1653 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1653 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23018] The complementary binding of GAM1653 RNA, herein designated GAM RNA, to target binding sites on GAM1653 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1653 target RNA, herein designated GAM TARGET RNA, into GAM1653 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23019] It is appreciated that GAM1653 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1653 target genes. The mRNA of each one of this plurality of GAM1653 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1653 RNA, herein designated GAM RNA, and which when bound by GAM1653 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1653 target proteins.

[23020] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1653 gene, herein designated GAM GENE, on one or more GAM1653 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23021] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1653 correlate with, and may be deduced from, the identity of the target

genes which GAM1653 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23022] Nucleotide sequences of the GAM1653 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1653 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1653 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1653 are further described hereinbelow with reference to Table 1.

[23023] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1653 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23024] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1654 (GAM1654) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23025] GAM1654 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1654 was detected is described hereinabove with reference to Figs. 2-8.

[23026] GAM1654 gene, herein designated GAM GENE, and GAM1654 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[23027] GAM1654 gene, herein designated GAM GENE, encodes a GAM1654 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1654 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1654 precursor RNA is designated SEQ ID:1631, and is provided hereinbelow with reference to the sequence listing part.

[23028] GAM1654 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1654 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23029] An enzyme complex designated DICER COMPLEX, dices the GAM1654 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1654 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1654 RNA is designated SEQ ID:4236, and is provided

hereinbelow with reference to the sequence listing part.

[23030] GAM1654 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1654 target RNA, herein designated GAM TARGET RNA. GAM1654 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23031] GAM1654 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1654 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1654 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1654 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1654 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23032] The complementary binding of GAM1654 RNA, herein designated GAM RNA, to target binding sites on GAM1654 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1654 target RNA, herein designated GAM TARGET RNA, into GAM1654 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23033] It is appreciated that GAM1654 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1654 target genes. The mRNA of each one of this plurality of GAM1654 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1654 RNA, herein designated GAM RNA, and which when bound by GAM1654 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1654 target proteins.

[23034] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1654 gene, herein designated GAM GENE, on one or more GAM1654 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23035] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1654 correlate with, and may be deduced from, the identity of the target genes which GAM1654 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23036] Nucleotide sequences of the GAM1654 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1654 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1654 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1654 are further described hereinbelow with reference to Table 1.

[23037] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1654 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23038] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1655 (GAM1655) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23039] GAM1655 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1655 was detected is described hereinabove with reference to Figs. 2-8.

[23040] GAM1655 gene, herein designated GAM GENE, and GAM1655 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23041] GAM1655 gene, herein designated GAM GENE, encodes a GAM1655 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1655 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1655 precursor RNA is designated SEQ ID:1632, and is provided hereinbelow with reference to the sequence listing part.

[23042] GAM1655 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1655 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23043] An enzyme complex designated DICER COMPLEX, dices the GAM1655 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1655 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1655 RNA is designated SEQ ID:4237, and is provided hereinbelow with reference to the sequence listing part.

[23044] GAM1655 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1655 target RNA, herein designated GAM TARGET RNA. GAM1655 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23045] GAM1655 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1655 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1655 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1655 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1655 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23046] The complementary binding of GAM1655 RNA, herein designated GAM RNA, to target binding sites on GAM1655 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1655 target RNA, herein designated GAM TARGET RNA, into GAM1655 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23047] It is appreciated that GAM1655 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1655 target genes. The mRNA of each one of this plurality of GAM1655 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1655 RNA, herein designated GAM RNA, and which when bound by GAM1655 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1655 target proteins.

[23048] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1655 gene, herein designated GAM GENE, on one or more GAM1655 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23049] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1655 correlate with, and may be deduced from, the identity of the target genes which GAM1655 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23050] Nucleotide sequences of the GAM1655 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1655 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1655 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1655 are further described hereinbelow with reference to Table 1.

[23051] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1655 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23052] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1656 (GAM1656) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23053] GAM1656 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1656 was detected is described hereinabove with reference to Figs. 2-8.

[23054] GAM1656 gene, herein designated GAM GENE, and GAM1656 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23055] GAM1656 gene, herein designated GAM GENE, encodes a GAM1656 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1656 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1656 precursor RNA is designated SEQ ID:1633, and is provided hereinbelow with reference to the sequence listing part.

[23056] GAM1656 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1656 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23057] An enzyme complex designated DICER COMPLEX, dices the GAM1656 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1656 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1656 RNA is designated SEQ ID:4238, and is provided hereinbelow with reference to the sequence listing part.

[23058] GAM1656 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1656 target RNA, herein designated GAM TARGET RNA. GAM1656 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23059] GAM1656 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1656 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1656 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1656 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1656 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23060] The complementary binding of GAM1656 RNA, herein designated GAM RNA, to target binding sites on GAM1656 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1656 target RNA, herein designated GAM TARGET RNA, into GAM1656 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23061] It is appreciated that GAM1656 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1656 target genes. The mRNA of each one of this plurality of GAM1656 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1656 RNA, herein designated GAM RNA, and which when bound by GAM1656 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1656 target proteins.

[23062] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1656 gene, herein designated GAM GENE, on one or more GAM1656 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23063] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1656 correlate with, and may be deduced from, the identity of the target genes which GAM1656 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23064] Nucleotide sequences of the GAM1656 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1656 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1656 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1656 are further described hereinbelow with reference to Table 1.

[23065] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1656 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[23066] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1657 (GAM1657) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23067] GAM1657 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1657 was detected is described hereinabove with reference to Figs. 2-8.

[23068] GAM1657 gene, herein designated GAM GENE, and GAM1657 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23069] GAM1657 gene, herein designated GAM GENE, encodes a GAM1657 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1657 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1657 precursor RNA is designated SEQ ID:1634, and is provided hereinbelow with reference to the sequence listing part.

[23070] GAM1657 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1657 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23071] An enzyme complex designated DICER COMPLEX, dices the GAM1657 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1657 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1657 RNA is designated SEQ ID:4239, and is provided hereinbelow with reference to the sequence listing part.

[23072] GAM1657 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1657 target RNA, herein designated GAM TARGET RNA. GAM1657 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23073] GAM1657 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1657 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1657 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1657 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1657 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23074] The complementary binding of GAM1657 RNA, herein designated GAM RNA, to target binding sites on GAM1657 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1657 target RNA, herein designated GAM TARGET RNA, into GAM1657 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23075] It is appreciated that GAM1657 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1657 target genes. The mRNA of each one of this plurality of GAM1657 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1657 RNA, herein designated GAM RNA, and which when bound by GAM1657 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1657 target proteins.

[23076] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1657 gene, herein designated GAM GENE, on one or more GAM1657 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23077] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1657 correlate with, and may be deduced from, the identity of the target genes which GAM1657 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23078] Nucleotide sequences of the GAM1657 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1657 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1657 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1657 are further described hereinbelow with reference to Table 1.

[23079] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1657 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23080] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1658 (GAM1658) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23081] GAM1658 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1658 was detected is described hereinabove with reference to Figs. 2-8.

[23082] GAM1658 gene, herein designated GAM GENE, and GAM1658 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23083] GAM1658 gene, herein designated GAM GENE, encodes a GAM1658 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1658 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1658 precursor RNA is designated SEQ ID:1635, and is provided hereinbelow with reference to the sequence listing part.

[23084] GAM1658 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1658 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23085] An enzyme complex designated DICER COMPLEX, dices the GAM1658 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1658 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1658 RNA is designated SEQ ID:4240, and is provided hereinbelow with reference to the sequence listing part.

[23086] GAM1658 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1658 target RNA, herein designated GAM TARGET RNA. GAM1658 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23087] GAM1658 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1658 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1658 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1658 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1658 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23088] The complementary binding of GAM1658 RNA, herein designated GAM RNA, to target binding sites on GAM1658 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1658 target RNA, herein designated GAM TARGET RNA, into GAM1658 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23089] It is appreciated that GAM1658 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1658 target genes. The

mRNA of each one of this plurality of GAM1658 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1658 RNA, herein designated GAM RNA, and which when bound by GAM1658 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1658 target proteins.

[23090] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1658 gene, herein designated GAM GENE, on one or more GAM1658 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23091] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1658 correlate with, and may be deduced from, the identity of the target genes which GAM1658 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23092] Nucleotide sequences of the GAM1658 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1658 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1658 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1658 are further described hereinbelow with reference to Table 1.

[23093] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1658 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23094] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1659 (GAM1659) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23095] GAM1659 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1659 was detected is described hereinabove with reference to Figs. 2-8.

[23096] GAM1659 gene, herein designated GAM GENE, and GAM1659 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23097] GAM1659 gene, herein designated GAM GENE, encodes a GAM1659 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1659 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1659 precursor RNA is designated SEQ ID:1636, and is provided hereinbelow with reference to the sequence listing part.

[23098] GAM1659 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1659 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23099] An enzyme complex designated DICER COMPLEX, dices the GAM1659 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1659 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1659 RNA is designated SEQ ID:4241, and is provided hereinbelow with reference to the sequence listing part.

[23100] GAM1659 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1659 target RNA, herein designated GAM TARGET RNA. GAM1659 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23101] GAM1659 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1659 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1659 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1659 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1659 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23102] The complementary binding of GAM1659 RNA, herein designated GAM RNA, to target binding sites on GAM1659 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1659 target RNA, herein designated GAM TARGET RNA, into GAM1659 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23103] It is appreciated that GAM1659 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1659 target genes. The mRNA of each one of this plurality of GAM1659 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1659 RNA, herein designated GAM RNA, and which when bound by GAM1659 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1659 target proteins.

[23104] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1659 gene, herein designated GAM GENE, on one or more GAM1659 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23105] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1659 correlate with, and may be deduced from, the identity of the target

genes which GAM1659 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23106] Nucleotide sequences of the GAM1659 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1659 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1659 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1659 are further described hereinbelow with reference to Table 1.

[23107] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1659 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23108] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1660 (GAM1660) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23109] GAM1660 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1660 was detected is described hereinabove with reference to Figs. 2-8.

[23110] GAM1660 gene, herein designated GAM GENE, and GAM1660 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[23111] GAM1660 gene, herein designated GAM GENE, encodes a GAM1660 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1660 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1660 precursor RNA is designated SEQ ID:1637, and is provided hereinbelow with reference to the sequence listing part.

[23112] GAM1660 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1660 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23113] An enzyme complex designated DICER COMPLEX, dices the GAM1660 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1660 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1660 RNA is designated SEQ ID:4242, and is provided

hereinbelow with reference to the sequence listing part.

[23114] GAM1660 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1660 target RNA, herein designated GAM TARGET RNA. GAM1660 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23115] GAM1660 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1660 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1660 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1660 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1660 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23116] The complementary binding of GAM1660 RNA, herein designated GAM RNA, to target binding sites on GAM1660 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1660 target RNA, herein designated GAM TARGET RNA, into GAM1660 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23117] It is appreciated that GAM1660 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1660 target genes. The mRNA of each one of this plurality of GAM1660 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1660 RNA, herein designated GAM RNA, and which when bound by GAM1660 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1660 target proteins.

[23118] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1660 gene, herein designated GAM GENE, on one or more GAM1660 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23119] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1660 correlate with, and may be deduced from, the identity of the target genes which GAM1660 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23120] Nucleotide sequences of the GAM1660 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1660 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1660 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1660 are further described hereinbelow with reference to Table 1.

[23121] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1660 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23122] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1661 (GAM1661) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23123] GAM1661 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1661 was detected is described hereinabove with reference to Figs. 2-8.

[23124] GAM1661 gene, herein designated GAM GENE, and GAM1661 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23125] GAM1661 gene, herein designated GAM GENE, encodes a GAM1661 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1661 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1661 precursor RNA is designated SEQ ID:1638, and is provided hereinbelow with reference to the sequence listing part.

[23126] GAM1661 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1661 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23127] An enzyme complex designated DICER COMPLEX, dices the GAM1661 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1661 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1661 RNA is designated SEQ ID:4243, and is provided hereinbelow with reference to the sequence listing part.

[23128] GAM1661 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1661 target RNA, herein designated GAM TARGET RNA. GAM1661 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23129] GAM1661 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1661 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1661 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1661 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1661 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23130] The complementary binding of GAM1661 RNA, herein designated GAM RNA, to target binding sites on GAM1661 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1661 target RNA, herein designated GAM TARGET RNA, into GAM1661 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23131] It is appreciated that GAM1661 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1661 target genes. The mRNA of each one of this plurality of GAM1661 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1661 RNA, herein designated GAM RNA, and which when bound by GAM1661 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1661 target proteins.

[23132] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1661 gene, herein designated GAM GENE, on one or more GAM1661 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23133] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1661 correlate with, and may be deduced from, the identity of the target genes which GAM1661 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23134] Nucleotide sequences of the GAM1661 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1661 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1661 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1661 are further described hereinbelow with reference to Table 1.

[23135] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1661 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23136] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1662 (GAM1662) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23137] GAM1662 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1662 was detected is described hereinabove with reference to Figs. 2-8.

[23138] GAM1662 gene, herein designated GAM GENE, and GAM1662 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23139] GAM1662 gene, herein designated GAM GENE, encodes a GAM1662 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1662 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1662 precursor RNA is designated SEQ ID:1639, and is provided hereinbelow with reference to the sequence listing part.

[23140] GAM1662 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1662 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23141] An enzyme complex designated DICER COMPLEX, dices the GAM1662 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1662 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1662 RNA is designated SEQ ID:4245, and is provided hereinbelow with reference to the sequence listing part.

[23142] GAM1662 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1662 target RNA, herein designated GAM TARGET RNA. GAM1662 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23143] GAM1662 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1662 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1662 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1662 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1662 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23144] The complementary binding of GAM1662 RNA, herein designated GAM RNA, to target binding sites on GAM1662 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1662 target RNA, herein designated GAM TARGET RNA, into GAM1662 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23145] It is appreciated that GAM1662 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1662 target genes. The mRNA of each one of this plurality of GAM1662 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1662 RNA, herein designated GAM RNA, and which when bound by GAM1662 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1662 target proteins.

[23146] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1662 gene, herein designated GAM GENE, on one or more GAM1662 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23147] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1662 correlate with, and may be deduced from, the identity of the target genes which GAM1662 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23148] Nucleotide sequences of the GAM1662 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1662 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1662 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1662 are further described hereinbelow with reference to Table 1.

[23149] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1662 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[23150] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1663 (GAM1663) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23151] GAM1663 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1663 was detected is described hereinabove with reference to Figs. 2-8.

[23152] GAM1663 gene, herein designated GAM GENE, and GAM1663 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23153] GAM1663 gene, herein designated GAM GENE, encodes a GAM1663 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1663 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1663 precursor RNA is designated SEQ ID:1640, and is provided hereinbelow with reference to the sequence listing part.

[23154] GAM1663 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1663 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23155] An enzyme complex designated DICER COMPLEX, dices the GAM1663 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1663 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1663 RNA is designated SEQ ID:4244, and is provided hereinbelow with reference to the sequence listing part.

[23156] GAM1663 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1663 target RNA, herein designated GAM TARGET RNA. GAM1663 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23157] GAM1663 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1663 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1663 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1663 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1663 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23158] The complementary binding of GAM1663 RNA, herein designated GAM RNA, to target binding sites on GAM1663 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1663 target RNA, herein designated GAM TARGET RNA, into GAM1663 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23159] It is appreciated that GAM1663 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1663 target genes. The mRNA of each one of this plurality of GAM1663 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1663 RNA, herein designated GAM RNA, and which when bound by GAM1663 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1663 target proteins.

[23160] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1663 gene, herein designated GAM GENE, on one or more GAM1663 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23161] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1663 correlate with, and may be deduced from, the identity of the target genes which GAM1663 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23162] Nucleotide sequences of the GAM1663 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1663 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1663 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1663 are further described hereinbelow with reference to Table 1.

[23163] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1663 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23164] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1664 (GAM1664) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23165] GAM1664 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1664 was detected is described hereinabove with reference to Figs. 2-8.

[23166] GAM1664 gene, herein designated GAM GENE, and GAM1664 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23167] GAM1664 gene, herein designated GAM GENE, encodes a GAM1664 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1664 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1664 precursor RNA is designated SEQ ID:1641, and is provided hereinbelow with reference to the sequence listing part.

[23168] GAM1664 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1664 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23169] An enzyme complex designated DICER COMPLEX, dices the GAM1664 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1664 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1664 RNA is designated SEQ ID:4246, and is provided hereinbelow with reference to the sequence listing part.

[23170] GAM1664 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1664 target RNA, herein designated GAM TARGET RNA. GAM1664 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23171] GAM1664 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1664 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1664 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1664 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1664 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23172] The complementary binding of GAM1664 RNA, herein designated GAM RNA, to target binding sites on GAM1664 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1664 target RNA, herein designated GAM TARGET RNA, into GAM1664 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23173] It is appreciated that GAM1664 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1664 target genes. The

mRNA of each one of this plurality of GAM1664 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1664 RNA, herein designated GAM RNA, and which when bound by GAM1664 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1664 target proteins.

[23174] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1664 gene, herein designated GAM GENE, on one or more GAM1664 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23175] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1664 correlate with, and may be deduced from, the identity of the target genes which GAM1664 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23176] Nucleotide sequences of the GAM1664 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1664 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1664 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1664 are further described hereinbelow with reference to Table 1.

[23177] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1664 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23178] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1665 (GAM1665) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23179] GAM1665 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1665 was detected is described hereinabove with reference to Figs. 2-8.

[23180] GAM1665 gene, herein designated GAM GENE, and GAM1665 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23181] GAM1665 gene, herein designated GAM GENE, encodes a GAM1665 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1665 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1665 precursor RNA is designated SEQ ID:1642, and is provided hereinbelow with reference to the sequence listing part.

[23182] GAM1665 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1665 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23183] An enzyme complex designated DICER COMPLEX, dices the GAM1665 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1665 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1665 RNA is designated SEQ ID:4247, and is provided hereinbelow with reference to the sequence listing part.

[23184] GAM1665 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1665 target RNA, herein designated GAM TARGET RNA. GAM1665 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23185] GAM1665 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1665 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1665 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1665 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1665 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23186] The complementary binding of GAM1665 RNA, herein designated GAM RNA, to target binding sites on GAM1665 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1665 target RNA, herein designated GAM TARGET RNA, into GAM1665 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23187] It is appreciated that GAM1665 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1665 target genes. The mRNA of each one of this plurality of GAM1665 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1665 RNA, herein designated GAM RNA, and which when bound by GAM1665 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1665 target proteins.

[23188] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1665 gene, herein designated GAM GENE, on one or more GAM1665 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23189] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1665 correlate with, and may be deduced from, the identity of the target

genes which GAM1665 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23190] Nucleotide sequences of the GAM1665 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1665 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1665 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1665 are further described hereinbelow with reference to Table 1.

[23191] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1665 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23192] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1666 (GAM1666) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23193] GAM1666 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1666 was detected is described hereinabove with reference to Figs. 2-8.

[23194] GAM1666 gene, herein designated GAM GENE, and GAM1666 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[23195] GAM1666 gene, herein designated GAM GENE, encodes a GAM1666 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1666 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1666 precursor RNA is designated SEQ ID:1643, and is provided hereinbelow with reference to the sequence listing part.

[23196] GAM1666 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1666 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23197] An enzyme complex designated DICER COMPLEX, dices the GAM1666 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1666 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1666 RNA is designated SEQ ID:4248, and is provided

hereinbelow with reference to the sequence listing part.

[23198] GAM1666 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1666 target RNA, herein designated GAM TARGET RNA. GAM1666 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23199] GAM1666 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1666 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1666 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1666 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1666 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23200] The complementary binding of GAM1666 RNA, herein designated GAM RNA, to target binding sites on GAM1666 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1666 target RNA, herein designated GAM TARGET RNA, into GAM1666 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23201] It is appreciated that GAM1666 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1666 target genes. The mRNA of each one of this plurality of GAM1666 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1666 RNA, herein designated GAM RNA, and which when bound by GAM1666 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1666 target proteins.

[23202] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1666 gene, herein designated GAM GENE, on one or more GAM1666 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23203] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1666 correlate with, and may be deduced from, the identity of the target genes which GAM1666 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23204] Nucleotide sequences of the GAM1666 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1666 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1666 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1666 are further described hereinbelow with reference to Table 1.

[23205] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1666 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23206] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1667 (GAM1667) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23207] GAM1667 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1667 was detected is described hereinabove with reference to Figs. 2-8.

[23208] GAM1667 gene, herein designated GAM GENE, and GAM1667 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23209] GAM1667 gene, herein designated GAM GENE, encodes a GAM1667 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1667 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1667 precursor RNA is designated SEQ ID:1644, and is provided hereinbelow with reference to the sequence listing part.

[23210] GAM1667 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1667 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23211] An enzyme complex designated DICER COMPLEX, dices the GAM1667 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1667 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1667 RNA is designated SEQ ID:4249, and is provided hereinbelow with reference to the sequence listing part.

[23212] GAM1667 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1667 target RNA, herein designated GAM TARGET RNA. GAM1667 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23213] GAM1667 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1667 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1667 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1667 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1667 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23214] The complementary binding of GAM1667 RNA, herein designated GAM RNA, to target binding sites on GAM1667 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1667 target RNA, herein designated GAM TARGET RNA, into GAM1667 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23215] It is appreciated that GAM1667 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1667 target genes. The mRNA of each one of this plurality of GAM1667 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1667 RNA, herein designated GAM RNA, and which when bound by GAM1667 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1667 target proteins.

[23216] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1667 gene, herein designated GAM GENE, on one or more GAM1667 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23217] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1667 correlate with, and may be deduced from, the identity of the target genes which GAM1667 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23218] Nucleotide sequences of the GAM1667 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1667 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1667 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1667 are further described hereinbelow with reference to Table 1.

[23219] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1667 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23220] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1668 (GAM1668) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23221] GAM1668 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1668 was detected is described hereinabove with reference to Figs. 2-8.

[23222] GAM1668 gene, herein designated GAM GENE, and GAM1668 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23223] GAM1668 gene, herein designated GAM GENE, encodes a GAM1668 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1668 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1668 precursor RNA is designated SEQ ID:1645, and is provided hereinbelow with reference to the sequence listing part.

[23224] GAM1668 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1668 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23225] An enzyme complex designated DICER COMPLEX, dices the GAM1668 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1668 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1668 RNA is designated SEQ ID:4250, and is provided hereinbelow with reference to the sequence listing part.

[23226] GAM1668 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1668 target RNA, herein designated GAM TARGET RNA. GAM1668 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23227] GAM1668 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1668 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1668 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1668 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1668 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23228] The complementary binding of GAM1668 RNA, herein designated GAM RNA, to target binding sites on GAM1668 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1668 target RNA, herein designated GAM TARGET RNA, into GAM1668 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23229] It is appreciated that GAM1668 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1668 target genes. The mRNA of each one of this plurality of GAM1668 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1668 RNA, herein designated GAM RNA, and which when bound by GAM1668 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1668 target proteins.

[23230] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1668 gene, herein designated GAM GENE, on one or more GAM1668 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23231] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1668 correlate with, and may be deduced from, the identity of the target genes which GAM1668 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23232] Nucleotide sequences of the GAM1668 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1668 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1668 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1668 are further described hereinbelow with reference to Table 1.

[23233] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1668 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[23234] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1669 (GAM1669) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23235] GAM1669 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1669 was detected is described hereinabove with reference to Figs. 2-8.

[23236] GAM1669 gene, herein designated GAM GENE, and GAM1669 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23237] GAM1669 gene, herein designated GAM GENE, encodes a GAM1669 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1669 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1669 precursor RNA is designated SEQ ID:1646, and is provided hereinbelow with reference to the sequence listing part.

[23238] GAM1669 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1669 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23239] An enzyme complex designated DICER COMPLEX, dices the GAM1669 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1669 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1669 RNA is designated SEQ ID:4251, and is provided hereinbelow with reference to the sequence listing part.

[23240] GAM1669 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1669 target RNA, herein designated GAM TARGET RNA. GAM1669 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23241] GAM1669 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1669 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1669 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1669 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1669 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23242] The complementary binding of GAM1669 RNA, herein designated GAM RNA, to target binding sites on GAM1669 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1669 target RNA, herein designated GAM TARGET RNA, into GAM1669 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23243] It is appreciated that GAM1669 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1669 target genes. The mRNA of each one of this plurality of GAM1669 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1669 RNA, herein designated GAM RNA, and which when bound by GAM1669 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1669 target proteins.

[23244] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1669 gene, herein designated GAM GENE, on one or more GAM1669 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23245] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1669 correlate with, and may be deduced from, the identity of the target genes which GAM1669 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23246] Nucleotide sequences of the GAM1669 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1669 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1669 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1669 are further described hereinbelow with reference to Table 1.

[23247] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1669 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23248] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1670 (GAM1670) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23249] GAM1670 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1670 was detected is described hereinabove with reference to Figs. 2-8.

[23250] GAM1670 gene, herein designated GAM GENE, and GAM1670 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23251] GAM1670 gene, herein designated GAM GENE, encodes a GAM1670 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1670 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1670 precursor RNA is designated SEQ ID:1647, and is provided hereinbelow with reference to the sequence listing part.

[23252] GAM1670 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1670 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23253] An enzyme complex designated DICER COMPLEX, dices the GAM1670 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1670 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1670 RNA is designated SEQ ID:4252, and is provided hereinbelow with reference to the sequence listing part.

[23254] GAM1670 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1670 target RNA, herein designated GAM TARGET RNA. GAM1670 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23255] GAM1670 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1670 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1670 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1670 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1670 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23256] The complementary binding of GAM1670 RNA, herein designated GAM RNA, to target binding sites on GAM1670 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1670 target RNA, herein designated GAM TARGET RNA, into GAM1670 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23257] It is appreciated that GAM1670 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1670 target genes. The

mRNA of each one of this plurality of GAM1670 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1670 RNA, herein designated GAM RNA, and which when bound by GAM1670 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1670 target proteins.

[23258] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1670 gene, herein designated GAM GENE, on one or more GAM1670 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23259] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1670 correlate with, and may be deduced from, the identity of the target genes which GAM1670 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23260] Nucleotide sequences of the GAM1670 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1670 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1670 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1670 are further described hereinbelow with reference to Table 1.

[23261] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1670 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23262] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1671 (GAM1671) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23263] GAM1671 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1671 was detected is described hereinabove with reference to Figs. 2-8.

[23264] GAM1671 gene, herein designated GAM GENE, and GAM1671 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23265] GAM1671 gene, herein designated GAM GENE, encodes a GAM1671 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1671 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1671 precursor RNA is designated SEQ ID:1648, and is provided hereinbelow with reference to the sequence listing part.

[23266] GAM1671 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1671 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23267] An enzyme complex designated DICER COMPLEX, dices the GAM1671 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1671 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1671 RNA is designated SEQ ID:4253, and is provided hereinbelow with reference to the sequence listing part.

[23268] GAM1671 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1671 target RNA, herein designated GAM TARGET RNA. GAM1671 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23269] GAM1671 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1671 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1671 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1671 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1671 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23270] The complementary binding of GAM1671 RNA, herein designated GAM RNA, to target binding sites on GAM1671 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1671 target RNA, herein designated GAM TARGET RNA, into GAM1671 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23271] It is appreciated that GAM1671 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1671 target genes. The mRNA of each one of this plurality of GAM1671 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1671 RNA, herein designated GAM RNA, and which when bound by GAM1671 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1671 target proteins.

[23272] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1671 gene, herein designated GAM GENE, on one or more GAM1671 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23273] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1671 correlate with, and may be deduced from, the identity of the target

genes which GAM1671 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23274] Nucleotide sequences of the GAM1671 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1671 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1671 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1671 are further described hereinbelow with reference to Table 1.

[23275] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1671 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23276] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1672 (GAM1672) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23277] GAM1672 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1672 was detected is described hereinabove with reference to Figs. 2-8.

[23278] GAM1672 gene, herein designated GAM GENE, and GAM1672 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[23279] GAM1672 gene, herein designated GAM GENE, encodes a GAM1672 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1672 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1672 precursor RNA is designated SEQ ID:1649, and is provided hereinbelow with reference to the sequence listing part.

[23280] GAM1672 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1672 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23281] An enzyme complex designated DICER COMPLEX, dices the GAM1672 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1672 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1672 RNA is designated SEQ ID:4254, and is provided

hereinbelow with reference to the sequence listing part.

[23282] GAM1672 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1672 target RNA, herein designated GAM TARGET RNA. GAM1672 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23283] GAM1672 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1672 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1672 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1672 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1672 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23284] The complementary binding of GAM1672 RNA, herein designated GAM RNA, to target binding sites on GAM1672 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1672 target RNA, herein designated GAM TARGET RNA, into GAM1672 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23285] It is appreciated that GAM1672 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1672 target genes. The mRNA of each one of this plurality of GAM1672 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1672 RNA, herein designated GAM RNA, and which when bound by GAM1672 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1672 target proteins.

[23286] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1672 gene, herein designated GAM GENE, on one or more GAM1672 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23287] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1672 correlate with, and may be deduced from, the identity of the target genes which GAM1672 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23288] Nucleotide sequences of the GAM1672 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1672 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1672 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1672 are further described hereinbelow with reference to Table 1.

[23289] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1672 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23290] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1673 (GAM1673) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23291] GAM1673 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1673 was detected is described hereinabove with reference to Figs. 2-8.

[23292] GAM1673 gene, herein designated GAM GENE, and GAM1673 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23293] GAM1673 gene, herein designated GAM GENE, encodes a GAM1673 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1673 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1673 precursor RNA is designated SEQ ID:1650, and is provided hereinbelow with reference to the sequence listing part.

[23294] GAM1673 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1673 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23295] An enzyme complex designated DICER COMPLEX, dices the GAM1673 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1673 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1673 RNA is designated SEQ ID:4255, and is provided hereinbelow with reference to the sequence listing part.

[23296] GAM1673 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1673 target RNA, herein designated GAM TARGET RNA. GAM1673 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23297] GAM1673 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1673 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1673 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1673 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1673 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23298] The complementary binding of GAM1673 RNA, herein designated GAM RNA, to target binding sites on GAM1673 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1673 target RNA, herein designated GAM TARGET RNA, into GAM1673 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23299] It is appreciated that GAM1673 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1673 target genes. The mRNA of each one of this plurality of GAM1673 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1673 RNA, herein designated GAM RNA, and which when bound by GAM1673 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1673 target proteins.

[23300] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1673 gene, herein designated GAM GENE, on one or more GAM1673 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23301] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1673 correlate with, and may be deduced from, the identity of the target genes which GAM1673 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23302] Nucleotide sequences of the GAM1673 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1673 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1673 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1673 are further described hereinbelow with reference to Table 1.

[23303] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1673 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23304] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1674 (GAM1674) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23305] GAM1674 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1674 was detected is described hereinabove with reference to Figs. 2-8.

[23306] GAM1674 gene, herein designated GAM GENE, and GAM1674 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23307] GAM1674 gene, herein designated GAM GENE, encodes a GAM1674 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1674 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1674 precursor RNA is designated SEQ ID:1651, and is provided hereinbelow with reference to the sequence listing part.

[23308] GAM1674 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23309] An enzyme complex designated DICER COMPLEX, dices the GAM1674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1674 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1674 RNA is designated SEQ ID:4256, and is provided hereinbelow with reference to the sequence listing part.

[23310] GAM1674 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1674 target RNA, herein designated GAM TARGET RNA. GAM1674 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23311] GAM1674 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1674 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1674 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1674 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1674 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23312] The complementary binding of GAM1674 RNA, herein designated GAM RNA, to target binding sites on GAM1674 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1674 target RNA, herein designated GAM TARGET RNA, into GAM1674 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23313] It is appreciated that GAM1674 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1674 target genes. The mRNA of each one of this plurality of GAM1674 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1674 RNA, herein designated GAM RNA, and which when bound by GAM1674 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1674 target proteins.

[23314] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1674 gene, herein designated GAM GENE, on one or more GAM1674 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23315] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1674 correlate with, and may be deduced from, the identity of the target genes which GAM1674 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23316] Nucleotide sequences of the GAM1674 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1674 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1674 are further described hereinbelow with reference to Table 1.

[23317] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1674 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[23318] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1675 (GAM1675) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23319] GAM1675 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1675 was detected is described hereinabove with reference to Figs. 2-8.

[23320] GAM1675 gene, herein designated GAM GENE, and GAM1675 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23321] GAM1675 gene, herein designated GAM GENE, encodes a GAM1675 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1675 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1675 precursor RNA is designated SEQ ID:1652, and is provided hereinbelow with reference to the sequence listing part.

[23322] GAM1675 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1675 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23323] An enzyme complex designated DICER COMPLEX, dices the GAM1675 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1675 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM1675 RNA is designated SEQ ID:4257, and is provided hereinbelow with reference to the sequence listing part.

[23324] GAM1675 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1675 target RNA, herein designated GAM TARGET RNA. GAM1675 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23325] GAM1675 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1675 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1675 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1675 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1675 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23326] The complementary binding of GAM1675 RNA, herein designated GAM RNA, to target binding sites on GAM1675 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1675 target RNA, herein designated GAM TARGET RNA, into GAM1675 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23327] It is appreciated that GAM1675 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1675 target genes. The mRNA of each one of this plurality of GAM1675 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1675 RNA, herein designated GAM RNA, and which when bound by GAM1675 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1675 target proteins.

[23328] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1675 gene, herein designated GAM GENE, on one or more GAM1675 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23329] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1675 correlate with, and may be deduced from, the identity of the target genes which GAM1675 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23330] Nucleotide sequences of the GAM1675 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1675 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1675 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1675 are further described hereinbelow with reference to Table 1.

[23331] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1675 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23332] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1676 (GAM1676) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23333] GAM1676 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1676 was detected is described hereinabove with reference to Figs. 2-8.

[23334] GAM1676 gene, herein designated GAM GENE, and GAM1676 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23335] GAM1676 gene, herein designated GAM GENE, encodes a GAM1676 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1676 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1676 precursor RNA is designated SEQ ID:1653, and is provided hereinbelow with reference to the sequence listing part.

[23336] GAM1676 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1676 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23337] An enzyme complex designated DICER COMPLEX, dices the GAM1676 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1676 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1676 RNA is designated SEQ ID:4258, and is provided hereinbelow with reference to the sequence listing part.

[23338] GAM1676 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1676 target RNA, herein designated GAM TARGET RNA. GAM1676 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23339] GAM1676 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1676 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1676 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1676 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1676 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23340] The complementary binding of GAM1676 RNA, herein designated GAM RNA, to target binding sites on GAM1676 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1676 target RNA, herein designated GAM TARGET RNA, into GAM1676 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23341] It is appreciated that GAM1676 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1676 target genes. The

mRNA of each one of this plurality of GAM1676 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1676 RNA, herein designated GAM RNA, and which when bound by GAM1676 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1676 target proteins.

[23342] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1676 gene, herein designated GAM GENE, on one or more GAM1676 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23343] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1676 correlate with, and may be deduced from, the identity of the target genes which GAM1676 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23344] Nucleotide sequences of the GAM1676 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1676 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1676 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1676 are further described hereinbelow with reference to Table 1.

[23345] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1676 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23346] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1677 (GAM1677) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23347] GAM1677 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1677 was detected is described hereinabove with reference to Figs. 2-8.

[23348] GAM1677 gene, herein designated GAM GENE, and GAM1677 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23349] GAM1677 gene, herein designated GAM GENE, encodes a GAM1677 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1677 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1677 precursor RNA is designated SEQ ID:1654, and is provided hereinbelow with reference to the sequence listing part.

[23350] GAM1677 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1677 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23351] An enzyme complex designated DICER COMPLEX, dices the GAM1677 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1677 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1677 RNA is designated SEQ ID:4259, and is provided hereinbelow with reference to the sequence listing part.

[23352] GAM1677 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1677 target RNA, herein designated GAM TARGET RNA. GAM1677 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23353] GAM1677 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1677 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1677 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1677 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1677 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23354] The complementary binding of GAM1677 RNA, herein designated GAM RNA, to target binding sites on GAM1677 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1677 target RNA, herein designated GAM TARGET RNA, into GAM1677 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23355] It is appreciated that GAM1677 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1677 target genes. The mRNA of each one of this plurality of GAM1677 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1677 RNA, herein designated GAM RNA, and which when bound by GAM1677 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1677 target proteins.

[23356] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1677 gene, herein designated GAM GENE, on one or more GAM1677 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23357] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1677 correlate with, and may be deduced from, the identity of the target

genes which GAM1677 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23358] Nucleotide sequences of the GAM1677 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1677 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1677 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1677 are further described hereinbelow with reference to Table 1.

[23359] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1677 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23360] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1678 (GAM1678) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23361] GAM1678 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1678 was detected is described hereinabove with reference to Figs. 2-8.

[23362] GAM1678 gene, herein designated GAM GENE, and GAM1678 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[23363] GAM1678 gene, herein designated GAM GENE, encodes a GAM1678 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1678 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1678 precursor RNA is designated SEQ ID:1655, and is provided hereinbelow with reference to the sequence listing part.

[23364] GAM1678 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1678 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23365] An enzyme complex designated DICER COMPLEX, dices the GAM1678 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1678 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1678 RNA is designated SEQ ID:4261, and is provided

hereinbelow with reference to the sequence listing part.

[23366] GAM1678 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1678 target RNA, herein designated GAM TARGET RNA. GAM1678 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23367] GAM1678 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1678 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1678 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1678 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1678 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23368] The complementary binding of GAM1678 RNA, herein designated GAM RNA, to target binding sites on GAM1678 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1678 target RNA, herein designated GAM TARGET RNA, into GAM1678 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23369] It is appreciated that GAM1678 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1678 target genes. The mRNA of each one of this plurality of GAM1678 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1678 RNA, herein designated GAM RNA, and which when bound by GAM1678 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1678 target proteins.

[23370] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1678 gene, herein designated GAM GENE, on one or more GAM1678 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23371] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1678 correlate with, and may be deduced from, the identity of the target genes which GAM1678 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23372] Nucleotide sequences of the GAM1678 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1678 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1678 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1678 are further described hereinbelow with reference to Table 1.

[23373] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1678 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23374] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1679 (GAM1679) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23375] GAM1679 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1679 was detected is described hereinabove with reference to Figs. 2-8.

[23376] GAM1679 gene, herein designated GAM GENE, and GAM1679 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23377] GAM1679 gene, herein designated GAM GENE, encodes a GAM1679 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1679 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1679 precursor RNA is designated SEQ ID:1656, and is provided hereinbelow with reference to the sequence listing part.

[23378] GAM1679 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1679 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23379] An enzyme complex designated DICER COMPLEX, dices the GAM1679 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1679 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1679 RNA is designated SEQ ID:4260, and is provided hereinbelow with reference to the sequence listing part.

[23380] GAM1679 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1679 target RNA, herein designated GAM TARGET RNA. GAM1679 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23381] GAM1679 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1679 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1679 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1679 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1679 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23382] The complementary binding of GAM1679 RNA, herein designated GAM RNA, to target binding sites on GAM1679 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1679 target RNA, herein designated GAM TARGET RNA, into GAM1679 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23383] It is appreciated that GAM1679 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1679 target genes. The mRNA of each one of this plurality of GAM1679 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1679 RNA, herein designated GAM RNA, and which when bound by GAM1679 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1679 target proteins.

[23384] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1679 gene, herein designated GAM GENE, on one or more GAM1679 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23385] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1679 correlate with, and may be deduced from, the identity of the target genes which GAM1679 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23386] Nucleotide sequences of the GAM1679 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1679 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1679 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1679 are further described hereinbelow with reference to Table 1.

[23387] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1679 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23388] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1680 (GAM1680) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23389] GAM1680 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1680 was detected is described hereinabove with reference to Figs. 2-8.

[23390] GAM1680 gene, herein designated GAM GENE, and GAM1680 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23391] GAM1680 gene, herein designated GAM GENE, encodes a GAM1680 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1680 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1680 precursor RNA is designated SEQ ID:1657, and is provided hereinbelow with reference to the sequence listing part.

[23392] GAM1680 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1680 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23393] An enzyme complex designated DICER COMPLEX, dices the GAM1680 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1680 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1680 RNA is designated SEQ ID:4262, and is provided hereinbelow with reference to the sequence listing part.

[23394] GAM1680 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1680 target RNA, herein designated GAM TARGET RNA. GAM1680 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23395] GAM1680 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1680 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1680 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1680 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1680 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23396] The complementary binding of GAM1680 RNA, herein designated GAM RNA, to target binding sites on GAM1680 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1680 target RNA, herein designated GAM TARGET RNA, into GAM1680 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23397] It is appreciated that GAM1680 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1680 target genes. The mRNA of each one of this plurality of GAM1680 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1680 RNA, herein designated GAM RNA, and which when bound by GAM1680 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1680 target proteins.

[23398] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1680 gene, herein designated GAM GENE, on one or more GAM1680 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23399] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1680 correlate with, and may be deduced from, the identity of the target genes which GAM1680 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23400] Nucleotide sequences of the GAM1680 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1680 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1680 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1680 are further described hereinbelow with reference to Table 1.

[23401] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1680 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[23402] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1681 (GAM1681) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23403] GAM1681 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1681 was detected is described hereinabove with reference to Figs. 2-8.

[23404] GAM1681 gene, herein designated GAM GENE, and GAM1681 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23405] GAM1681 gene, herein designated GAM GENE, encodes a GAM1681 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1681 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1681 precursor RNA is designated SEQ ID:1658, and is provided hereinbelow with reference to the sequence listing part.

[23406] GAM1681 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1681 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23407] An enzyme complex designated DICER COMPLEX, dices the GAM1681 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1681 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1681 RNA is designated SEQ ID:4263, and is provided hereinbelow with reference to the sequence listing part.

[23408] GAM1681 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1681 target RNA, herein designated GAM TARGET RNA. GAM1681 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23409] GAM1681 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1681 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1681 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1681 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1681 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23410] The complementary binding of GAM1681 RNA, herein designated GAM RNA, to target binding sites on GAM1681 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1681 target RNA, herein designated GAM TARGET RNA, into GAM1681 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23411] It is appreciated that GAM1681 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1681 target genes. The mRNA of each one of this plurality of GAM1681 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1681 RNA, herein designated GAM RNA, and which when bound by GAM1681 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1681 target proteins.

[23412] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1681 gene, herein designated GAM GENE, on one or more GAM1681 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23413] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1681 correlate with, and may be deduced from, the identity of the target genes which GAM1681 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23414] Nucleotide sequences of the GAM1681 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1681 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1681 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1681 are further described hereinbelow with reference to Table 1.

[23415] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1681 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23416] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1682 (GAM1682) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23417] GAM1682 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1682 was detected is described hereinabove with reference to Figs. 2-8.

[23418] GAM1682 gene, herein designated GAM GENE, and GAM1682 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23419] GAM1682 gene, herein designated GAM GENE, encodes a GAM1682 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1682 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1682 precursor RNA is designated SEQ ID:1659, and is provided hereinbelow with reference to the sequence listing part.

[23420] GAM1682 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1682 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23421] An enzyme complex designated DICER COMPLEX, dices the GAM1682 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1682 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1682 RNA is designated SEQ ID:4264, and is provided hereinbelow with reference to the sequence listing part.

[23422] GAM1682 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1682 target RNA, herein designated GAM TARGET RNA. GAM1682 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23423] GAM1682 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1682 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1682 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1682 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1682 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23424] The complementary binding of GAM1682 RNA, herein designated GAM RNA, to target binding sites on GAM1682 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1682 target RNA, herein designated GAM TARGET RNA, into GAM1682 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23425] It is appreciated that GAM1682 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1682 target genes. The

mRNA of each one of this plurality of GAM1682 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1682 RNA, herein designated GAM RNA, and which when bound by GAM1682 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1682 target proteins.

[23426] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1682 gene, herein designated GAM GENE, on one or more GAM1682 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23427] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1682 correlate with, and may be deduced from, the identity of the target genes which GAM1682 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23428] Nucleotide sequences of the GAM1682 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1682 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1682 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1682 are further described hereinbelow with reference to Table 1.

[23429] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1682 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23430] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1683 (GAM1683) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23431] GAM1683 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1683 was detected is described hereinabove with reference to Figs. 2-8.

[23432] GAM1683 gene, herein designated GAM GENE, and GAM1683 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23433] GAM1683 gene, herein designated GAM GENE, encodes a GAM1683 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1683 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1683 precursor RNA is designated SEQ ID:1660, and is provided hereinbelow with reference to the sequence listing part.

[23434] GAM1683 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1683 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23435] An enzyme complex designated DICER COMPLEX, dices the GAM1683 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1683 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1683 RNA is designated SEQ ID:4265, and is provided hereinbelow with reference to the sequence listing part.

[23436] GAM1683 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1683 target RNA, herein designated GAM TARGET RNA. GAM1683 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23437] GAM1683 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1683 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1683 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1683 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1683 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23438] The complementary binding of GAM1683 RNA, herein designated GAM RNA, to target binding sites on GAM1683 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1683 target RNA, herein designated GAM TARGET RNA, into GAM1683 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23439] It is appreciated that GAM1683 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1683 target genes. The mRNA of each one of this plurality of GAM1683 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1683 RNA, herein designated GAM RNA, and which when bound by GAM1683 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1683 target proteins.

[23440] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1683 gene, herein designated GAM GENE, on one or more GAM1683 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23441] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1683 correlate with, and may be deduced from, the identity of the target

genes which GAM1683 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23442] Nucleotide sequences of the GAM1683 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1683 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1683 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1683 are further described hereinbelow with reference to Table 1.

[23443] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1683 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23444] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1684 (GAM1684) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23445] GAM1684 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1684 was detected is described hereinabove with reference to Figs. 2-8.

[23446] GAM1684 gene, herein designated GAM GENE, and GAM1684 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[23447] GAM1684 gene, herein designated GAM GENE, encodes a GAM1684 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1684 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1684 precursor RNA is designated SEQ ID:1661, and is provided hereinbelow with reference to the sequence listing part.

[23448] GAM1684 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1684 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23449] An enzyme complex designated DICER COMPLEX, dices the GAM1684 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1684 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1684 RNA is designated SEQ ID:4266, and is provided

hereinbelow with reference to the sequence listing part.

[23450] GAM1684 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1684 target RNA, herein designated GAM TARGET RNA. GAM1684 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23451] GAM1684 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1684 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1684 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1684 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1684 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23452] The complementary binding of GAM1684 RNA, herein designated GAM RNA, to target binding sites on GAM1684 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1684 target RNA, herein designated GAM TARGET RNA, into GAM1684 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23453] It is appreciated that GAM1684 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1684 target genes. The mRNA of each one of this plurality of GAM1684 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1684 RNA, herein designated GAM RNA, and which when bound by GAM1684 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1684 target proteins.

[23454] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1684 gene, herein designated GAM GENE, on one or more GAM1684 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23455] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1684 correlate with, and may be deduced from, the identity of the target genes which GAM1684 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23456] Nucleotide sequences of the GAM1684 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1684 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1684 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1684 are further described hereinbelow with reference to Table 1.

[23457] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1684 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23458] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1685 (GAM1685) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23459] GAM1685 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1685 was detected is described hereinabove with reference to Figs. 2-8.

[23460] GAM1685 gene, herein designated GAM GENE, and GAM1685 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23461] GAM1685 gene, herein designated GAM GENE, encodes a GAM1685 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1685 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1685 precursor RNA is designated SEQ ID:1662, and is provided hereinbelow with reference to the sequence listing part.

[23462] GAM1685 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1685 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23463] An enzyme complex designated DICER COMPLEX, dices the GAM1685 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1685 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1685 RNA is designated SEQ ID:4267, and is provided hereinbelow with reference to the sequence listing part.

[23464] GAM1685 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1685 target RNA, herein designated GAM TARGET RNA. GAM1685 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23465] GAM1685 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1685 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1685 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1685 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1685 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23466] The complementary binding of GAM1685 RNA, herein designated GAM RNA, to target binding sites on GAM1685 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1685 target RNA, herein designated GAM TARGET RNA, into GAM1685 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23467] It is appreciated that GAM1685 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1685 target genes. The mRNA of each one of this plurality of GAM1685 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1685 RNA, herein designated GAM RNA, and which when bound by GAM1685 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1685 target proteins.

[23468] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1685 gene, herein designated GAM GENE, on one or more GAM1685 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23469] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1685 correlate with, and may be deduced from, the identity of the target genes which GAM1685 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23470] Nucleotide sequences of the GAM1685 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1685 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1685 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1685 are further described hereinbelow with reference to Table 1.

[23471] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1685 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[23472] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1686 (GAM1686) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23473] GAM1686 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1686 was detected is described hereinabove with reference to Figs. 2-8.

[23474] GAM1686 gene, herein designated GAM GENE, and GAM1686 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23475] GAM1686 gene, herein designated GAM GENE, encodes a GAM1686 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1686 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1686 precursor RNA is designated SEQ ID:1663, and is provided hereinbelow with reference to the sequence listing part.

[23476] GAM1686 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1686 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23477] An enzyme complex designated DICER COMPLEX, dices the GAM1686 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1686 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1686 RNA is designated SEQ ID:4268, and is provided hereinbelow with reference to the sequence listing part.

[23478] GAM1686 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1686 target RNA, herein designated GAM TARGET RNA. GAM1686 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23479] GAM1686 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1686 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1686 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1686 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1686 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23480] The complementary binding of GAM1686 RNA, herein designated GAM RNA, to target binding sites on GAM1686 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1686 target RNA, herein designated GAM TARGET RNA, into GAM1686 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23481] It is appreciated that GAM1686 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1686 target genes. The mRNA of each one of this plurality of GAM1686 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1686 RNA, herein designated GAM RNA, and which when bound by GAM1686 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1686 target proteins.

[23482] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1686 gene, herein designated GAM GENE, on one or more GAM1686 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23483] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1686 correlate with, and may be deduced from, the identity of the target genes which GAM1686 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23484] Nucleotide sequences of the GAM1686 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1686 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1686 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1686 are further described hereinbelow with reference to Table 1.

[23485] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1686 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23486] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1687 (GAM1687) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23487] GAM1687 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1687 was detected is described hereinabove with reference to Figs. 2-8.

[23488] GAM1687 gene, herein designated GAM GENE, and GAM1687 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23489] GAM1687 gene, herein designated GAM GENE, encodes a GAM1687 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1687 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1687 precursor RNA is designated SEQ ID:1664, and is provided hereinbelow with reference to the sequence listing part.

[23490] GAM1687 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1687 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23491] An enzyme complex designated DICER COMPLEX, dices the GAM1687 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1687 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1687 RNA is designated SEQ ID:4269, and is provided hereinbelow with reference to the sequence listing part.

[23492] GAM1687 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1687 target RNA, herein designated GAM TARGET RNA. GAM1687 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23493] GAM1687 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1687 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1687 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1687 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1687 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23494] The complementary binding of GAM1687 RNA, herein designated GAM RNA, to target binding sites on GAM1687 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1687 target RNA, herein designated GAM TARGET RNA, into GAM1687 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23495] It is appreciated that GAM1687 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1687 target genes. The

mRNA of each one of this plurality of GAM1687 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1687 RNA, herein designated GAM RNA, and which when bound by GAM1687 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1687 target proteins.

[23496] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1687 gene, herein designated GAM GENE, on one or more GAM1687 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23497] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1687 correlate with, and may be deduced from, the identity of the target genes which GAM1687 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23498] Nucleotide sequences of the GAM1687 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1687 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1687 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1687 are further described hereinbelow with reference to Table 1.

[23499] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1687 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23500] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1688 (GAM1688) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23501] GAM1688 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1688 was detected is described hereinabove with reference to Figs. 2-8.

[23502] GAM1688 gene, herein designated GAM GENE, and GAM1688 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23503] GAM1688 gene, herein designated GAM GENE, encodes a GAM1688 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1688 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1688 precursor RNA is designated SEQ ID:1665, and is provided hereinbelow with reference to the sequence listing part.

[23504] GAM1688 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1688 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23505] An enzyme complex designated DICER COMPLEX, dices the GAM1688 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1688 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1688 RNA is designated SEQ ID:4270, and is provided hereinbelow with reference to the sequence listing part.

[23506] GAM1688 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1688 target RNA, herein designated GAM TARGET RNA. GAM1688 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23507] GAM1688 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1688 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1688 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1688 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1688 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23508] The complementary binding of GAM1688 RNA, herein designated GAM RNA, to target binding sites on GAM1688 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1688 target RNA, herein designated GAM TARGET RNA, into GAM1688 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23509] It is appreciated that GAM1688 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1688 target genes. The mRNA of each one of this plurality of GAM1688 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1688 RNA, herein designated GAM RNA, and which when bound by GAM1688 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1688 target proteins.

[23510] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1688 gene, herein designated GAM GENE, on one or more GAM1688 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23511] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1688 correlate with, and may be deduced from, the identity of the target

genes which GAM1688 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23512] Nucleotide sequences of the GAM1688 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1688 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1688 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1688 are further described hereinbelow with reference to Table 1.

[23513] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1688 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23514] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1689 (GAM1689) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23515] GAM1689 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1689 was detected is described hereinabove with reference to Figs. 2-8.

[23516] GAM1689 gene, herein designated GAM GENE, and GAM1689 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[23517] GAM1689 gene, herein designated GAM GENE, encodes a GAM1689 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1689 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1689 precursor RNA is designated SEQ ID:1666, and is provided hereinbelow with reference to the sequence listing part.

[23518] GAM1689 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1689 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23519] An enzyme complex designated DICER COMPLEX, dices the GAM1689 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1689 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1689 RNA is designated SEQ ID:4271, and is provided

hereinbelow with reference to the sequence listing part.

[23520] GAM1689 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1689 target RNA, herein designated GAM TARGET RNA. GAM1689 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23521] GAM1689 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1689 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1689 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1689 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1689 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23522] The complementary binding of GAM1689 RNA, herein designated GAM RNA, to target binding sites on GAM1689 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1689 target RNA, herein designated GAM TARGET RNA, into GAM1689 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23523] It is appreciated that GAM1689 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1689 target genes. The mRNA of each one of this plurality of GAM1689 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1689 RNA, herein designated GAM RNA, and which when bound by GAM1689 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1689 target proteins.

[23524] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1689 gene, herein designated GAM GENE, on one or more GAM1689 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23525] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1689 correlate with, and may be deduced from, the identity of the target genes which GAM1689 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23526] Nucleotide sequences of the GAM1689 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1689 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1689 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1689 are further described hereinbelow with reference to Table 1.

[23527] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1689 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23528] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1690 (GAM1690) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23529] GAM1690 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1690 was detected is described hereinabove with reference to Figs. 2-8.

[23530] GAM1690 gene, herein designated GAM GENE, and GAM1690 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23531] GAM1690 gene, herein designated GAM GENE, encodes a GAM1690 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1690 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1690 precursor RNA is designated SEQ ID:1667, and is provided hereinbelow with reference to the sequence listing part.

[23532] GAM1690 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1690 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23533] An enzyme complex designated DICER COMPLEX, dices the GAM1690 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1690 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1690 RNA is designated SEQ ID:4272, and is provided hereinbelow with reference to the sequence listing part.

[23534] GAM1690 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1690 target RNA, herein designated GAM TARGET RNA. GAM1690 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23535] GAM1690 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1690 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1690 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1690 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1690 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23536] The complementary binding of GAM1690 RNA, herein designated GAM RNA, to target binding sites on GAM1690 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1690 target RNA, herein designated GAM TARGET RNA, into GAM1690 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23537] It is appreciated that GAM1690 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1690 target genes. The mRNA of each one of this plurality of GAM1690 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1690 RNA, herein designated GAM RNA, and which when bound by GAM1690 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1690 target proteins.

[23538] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1690 gene, herein designated GAM GENE, on one or more GAM1690 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23539] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1690 correlate with, and may be deduced from, the identity of the target genes which GAM1690 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23540] Nucleotide sequences of the GAM1690 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1690 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1690 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1690 are further described hereinbelow with reference to Table 1.

[23541] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1690 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23542] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1691 (GAM1691) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23543] GAM1691 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1691 was detected is described hereinabove with reference to Figs. 2-8.

[23544] GAM1691 gene, herein designated GAM GENE, and GAM1691 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23545] GAM1691 gene, herein designated GAM GENE, encodes a GAM1691 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1691 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1691 precursor RNA is designated SEQ ID:1668, and is provided hereinbelow with reference to the sequence listing part.

[23546] GAM1691 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1691 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23547] An enzyme complex designated DICER COMPLEX, dices the GAM1691 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1691 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1691 RNA is designated SEQ ID:4273, and is provided hereinbelow with reference to the sequence listing part.

[23548] GAM1691 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1691 target RNA, herein designated GAM TARGET RNA. GAM1691 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23549] GAM1691 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1691 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1691 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1691 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1691 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23550] The complementary binding of GAM1691 RNA, herein designated GAM RNA, to target binding sites on GAM1691 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1691 target RNA, herein designated GAM TARGET RNA, into GAM1691 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23551] It is appreciated that GAM1691 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1691 target genes. The mRNA of each one of this plurality of GAM1691 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1691 RNA, herein designated GAM RNA, and which when bound by GAM1691 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1691 target proteins.

[23552] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1691 gene, herein designated GAM GENE, on one or more GAM1691 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23553] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1691 correlate with, and may be deduced from, the identity of the target genes which GAM1691 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23554] Nucleotide sequences of the GAM1691 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1691 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1691 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1691 are further described hereinbelow with reference to Table 1.

[23555] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1691 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[23556] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1692 (GAM1692) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23557] GAM1692 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1692 was detected is described hereinabove with reference to Figs. 2-8.

[23558] GAM1692 gene, herein designated GAM GENE, and GAM1692 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23559] GAM1692 gene, herein designated GAM GENE, encodes a GAM1692 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1692 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1692 precursor RNA is designated SEQ ID:1669, and is provided hereinbelow with reference to the sequence listing part.

[23560] GAM1692 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1692 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23561] An enzyme complex designated DICER COMPLEX, dices the GAM1692 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1692 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1692 RNA is designated SEQ ID:4274, and is provided hereinbelow with reference to the sequence listing part.

[23562] GAM1692 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1692 target RNA, herein designated GAM TARGET RNA. GAM1692 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23563] GAM1692 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1692 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1692 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1692 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1692 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23564] The complementary binding of GAM1692 RNA, herein designated GAM RNA, to target binding sites on GAM1692 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1692 target RNA, herein designated GAM TARGET RNA, into GAM1692 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23565] It is appreciated that GAM1692 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1692 target genes. The mRNA of each one of this plurality of GAM1692 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1692 RNA, herein designated GAM RNA, and which when bound by GAM1692 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1692 target proteins.

[23566] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1692 gene, herein designated GAM GENE, on one or more GAM1692 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23567] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1692 correlate with, and may be deduced from, the identity of the target genes which GAM1692 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23568] Nucleotide sequences of the GAM1692 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1692 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1692 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1692 are further described hereinbelow with reference to Table 1.

[23569] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1692 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23570] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1693 (GAM1693) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23571] GAM1693 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1693 was detected is described hereinabove with reference to Figs. 2-8.

[23572] GAM1693 gene, herein designated GAM GENE, and GAM1693 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23573] GAM1693 gene, herein designated GAM GENE, encodes a GAM1693 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1693 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1693 precursor RNA is designated SEQ ID:1670, and is provided hereinbelow with reference to the sequence listing part.

[23574] GAM1693 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1693 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23575] An enzyme complex designated DICER COMPLEX, dices the GAM1693 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1693 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1693 RNA is designated SEQ ID:4275, and is provided hereinbelow with reference to the sequence listing part.

[23576] GAM1693 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1693 target RNA, herein designated GAM TARGET RNA. GAM1693 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23577] GAM1693 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1693 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1693 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1693 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1693 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23578] The complementary binding of GAM1693 RNA, herein designated GAM RNA, to target binding sites on GAM1693 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1693 target RNA, herein designated GAM TARGET RNA, into GAM1693 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23579] It is appreciated that GAM1693 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1693 target genes. The

mRNA of each one of this plurality of GAM1693 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1693 RNA, herein designated GAM RNA, and which when bound by GAM1693 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1693 target proteins.

[23580] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1693 gene, herein designated GAM GENE, on one or more GAM1693 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23581] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1693 correlate with, and may be deduced from, the identity of the target genes which GAM1693 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23582] Nucleotide sequences of the GAM1693 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1693 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1693 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1693 are further described hereinbelow with reference to Table 1.

[23583] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1693 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23584] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1694 (GAM1694) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23585] GAM1694 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1694 was detected is described hereinabove with reference to Figs. 2-8.

[23586] GAM1694 gene, herein designated GAM GENE, and GAM1694 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23587] GAM1694 gene, herein designated GAM GENE, encodes a GAM1694 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1694 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1694 precursor RNA is designated SEQ ID:1671, and is provided hereinbelow with reference to the sequence listing part.

[23588] GAM1694 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1694 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23589] An enzyme complex designated DICER COMPLEX, dices the GAM1694 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1694 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1694 RNA is designated SEQ ID:4276, and is provided hereinbelow with reference to the sequence listing part.

[23590] GAM1694 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1694 target RNA, herein designated GAM TARGET RNA. GAM1694 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23591] GAM1694 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1694 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1694 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1694 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1694 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23592] The complementary binding of GAM1694 RNA, herein designated GAM RNA, to target binding sites on GAM1694 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1694 target RNA, herein designated GAM TARGET RNA, into GAM1694 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23593] It is appreciated that GAM1694 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1694 target genes. The mRNA of each one of this plurality of GAM1694 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1694 RNA, herein designated GAM RNA, and which when bound by GAM1694 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1694 target proteins.

[23594] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1694 gene, herein designated GAM GENE, on one or more GAM1694 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23595] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1694 correlate with, and may be deduced from, the identity of the target

genes which GAM1694 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23596] Nucleotide sequences of the GAM1694 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1694 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1694 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1694 are further described hereinbelow with reference to Table 1.

[23597] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1694 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23598] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1695 (GAM1695) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23599] GAM1695 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1695 was detected is described hereinabove with reference to Figs. 2-8.

[23600] GAM1695 gene, herein designated GAM GENE, and GAM1695 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[23601] GAM1695 gene, herein designated GAM GENE, encodes a GAM1695 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1695 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1695 precursor RNA is designated SEQ ID:1672, and is provided hereinbelow with reference to the sequence listing part.

[23602] GAM1695 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1695 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23603] An enzyme complex designated DICER COMPLEX, dices the GAM1695 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1695 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1695 RNA is designated SEQ ID:4279, and is provided

hereinbelow with reference to the sequence listing part.

[23604] GAM1695 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1695 target RNA, herein designated GAM TARGET RNA. GAM1695 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23605] GAM1695 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1695 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1695 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1695 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1695 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23606] The complementary binding of GAM1695 RNA, herein designated GAM RNA, to target binding sites on GAM1695 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1695 target RNA, herein designated GAM TARGET RNA, into GAM1695 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23607] It is appreciated that GAM1695 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1695 target genes. The mRNA of each one of this plurality of GAM1695 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1695 RNA, herein designated GAM RNA, and which when bound by GAM1695 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1695 target proteins.

[23608] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1695 gene, herein designated GAM GENE, on one or more GAM1695 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23609] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1695 correlate with, and may be deduced from, the identity of the target genes which GAM1695 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23610] Nucleotide sequences of the GAM1695 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1695 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1695 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1695 are further described hereinbelow with reference to Table 1.

[23611] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1695 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23612] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1696 (GAM1696) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23613] GAM1696 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1696 was detected is described hereinabove with reference to Figs. 2-8.

[23614] GAM1696 gene, herein designated GAM GENE, and GAM1696 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23615] GAM1696 gene, herein designated GAM GENE, encodes a GAM1696 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1696 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1696 precursor RNA is designated SEQ ID:1673, and is provided hereinbelow with reference to the sequence listing part.

[23616] GAM1696 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1696 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23617] An enzyme complex designated DICER COMPLEX, dices the GAM1696 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1696 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1696 RNA is designated SEQ ID:4278, and is provided hereinbelow with reference to the sequence listing part.

[23618] GAM1696 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1696 target RNA, herein designated GAM TARGET RNA. GAM1696 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23619] GAM1696 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1696 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1696 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1696 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1696 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23620] The complementary binding of GAM1696 RNA, herein designated GAM RNA, to target binding sites on GAM1696 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1696 target RNA, herein designated GAM TARGET RNA, into GAM1696 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23621] It is appreciated that GAM1696 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1696 target genes. The mRNA of each one of this plurality of GAM1696 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1696 RNA, herein designated GAM RNA, and which when bound by GAM1696 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1696 target proteins.

[23622] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1696 gene, herein designated GAM GENE, on one or more GAM1696 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23623] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1696 correlate with, and may be deduced from, the identity of the target genes which GAM1696 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23624] Nucleotide sequences of the GAM1696 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1696 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1696 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1696 are further described hereinbelow with reference to Table 1.

[23625] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1696 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23626] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1697 (GAM1697) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23627] GAM1697 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1697 was detected is described hereinabove with reference to Figs. 2-8.

[23628] GAM1697 gene, herein designated GAM GENE, and GAM1697 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23629] GAM1697 gene, herein designated GAM GENE, encodes a GAM1697 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1697 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1697 precursor RNA is designated SEQ ID:1674, and is provided hereinbelow with reference to the sequence listing part.

[23630] GAM1697 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1697 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23631] An enzyme complex designated DICER COMPLEX, dices the GAM1697 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1697 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1697 RNA is designated SEQ ID:4277, and is provided hereinbelow with reference to the sequence listing part.

[23632] GAM1697 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1697 target RNA, herein designated GAM TARGET RNA. GAM1697 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23633] GAM1697 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1697 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1697 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1697 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1697 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23634] The complementary binding of GAM1697 RNA, herein designated GAM RNA, to target binding sites on GAM1697 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1697 target RNA, herein designated GAM TARGET RNA, into GAM1697 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23635] It is appreciated that GAM1697 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1697 target genes. The mRNA of each one of this plurality of GAM1697 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1697 RNA, herein designated GAM RNA, and which when bound by GAM1697 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1697 target proteins.

[23636] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1697 gene, herein designated GAM GENE, on one or more GAM1697 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23637] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1697 correlate with, and may be deduced from, the identity of the target genes which GAM1697 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23638] Nucleotide sequences of the GAM1697 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1697 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1697 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1697 are further described hereinbelow with reference to Table 1.

[23639] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1697 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[23640] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1698 (GAM1698) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23641] GAM1698 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1698 was detected is described hereinabove with reference to Figs. 2-8.

[23642] GAM1698 gene, herein designated GAM GENE, and GAM1698 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23643] GAM1698 gene, herein designated GAM GENE, encodes a GAM1698 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1698 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1698 precursor RNA is designated SEQ ID:1675, and is provided hereinbelow with reference to the sequence listing part.

[23644] GAM1698 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1698 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23645] An enzyme complex designated DICER COMPLEX, dices the GAM1698 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1698 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1698 RNA is designated SEQ ID:4280, and is provided hereinbelow with reference to the sequence listing part.

[23646] GAM1698 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1698 target RNA, herein designated GAM TARGET RNA. GAM1698 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23647] GAM1698 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1698 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1698 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1698 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1698 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23648] The complementary binding of GAM1698 RNA, herein designated GAM RNA, to target binding sites on GAM1698 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1698 target RNA, herein designated GAM TARGET RNA, into GAM1698 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23649] It is appreciated that GAM1698 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1698 target genes. The mRNA of each one of this plurality of GAM1698 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1698 RNA, herein designated GAM RNA, and which when bound by GAM1698 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1698 target proteins.

[23650] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1698 gene, herein designated GAM GENE, on one or more GAM1698 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23651] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1698 correlate with, and may be deduced from, the identity of the target genes which GAM1698 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23652] Nucleotide sequences of the GAM1698 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1698 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1698 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1698 are further described hereinbelow with reference to Table 1.

[23653] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1698 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23654] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1699 (GAM1699) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23655] GAM1699 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1699 was detected is described hereinabove with reference to Figs. 2-8.

[23656] GAM1699 gene, herein designated GAM GENE, and GAM1699 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23657] GAM1699 gene, herein designated GAM GENE, encodes a GAM1699 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1699 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1699 precursor RNA is designated SEQ ID:1676, and is provided hereinbelow with reference to the sequence listing part.

[23658] GAM1699 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1699 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23659] An enzyme complex designated DICER COMPLEX, dices the GAM1699 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1699 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1699 RNA is designated SEQ ID:4281, and is provided hereinbelow with reference to the sequence listing part.

[23660] GAM1699 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1699 target RNA, herein designated GAM TARGET RNA. GAM1699 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23661] GAM1699 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1699 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1699 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1699 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1699 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23662] The complementary binding of GAM1699 RNA, herein designated GAM RNA, to target binding sites on GAM1699 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1699 target RNA, herein designated GAM TARGET RNA, into GAM1699 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23663] It is appreciated that GAM1699 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1699 target genes. The

mRNA of each one of this plurality of GAM1699 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1699 RNA, herein designated GAM RNA, and which when bound by GAM1699 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1699 target proteins.

[23664] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1699 gene, herein designated GAM GENE, on one or more GAM1699 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23665] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1699 correlate with, and may be deduced from, the identity of the target genes which GAM1699 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23666] Nucleotide sequences of the GAM1699 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1699 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1699 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1699 are further described hereinbelow with reference to Table 1.

[23667] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1699 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23668] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1700 (GAM1700) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23669] GAM1700 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1700 was detected is described hereinabove with reference to Figs. 2-8.

[23670] GAM1700 gene, herein designated GAM GENE, and GAM1700 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23671] GAM1700 gene, herein designated GAM GENE, encodes a GAM1700 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1700 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1700 precursor RNA is designated SEQ ID:1677, and is provided hereinbelow with reference to the sequence listing part.

[23672] GAM1700 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1700 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23673] An enzyme complex designated DICER COMPLEX, dices the GAM1700 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1700 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1700 RNA is designated SEQ ID:4282, and is provided hereinbelow with reference to the sequence listing part.

[23674] GAM1700 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1700 target RNA, herein designated GAM TARGET RNA. GAM1700 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23675] GAM1700 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1700 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1700 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1700 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1700 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23676] The complementary binding of GAM1700 RNA, herein designated GAM RNA, to target binding sites on GAM1700 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1700 target RNA, herein designated GAM TARGET RNA, into GAM1700 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23677] It is appreciated that GAM1700 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1700 target genes. The mRNA of each one of this plurality of GAM1700 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1700 RNA, herein designated GAM RNA, and which when bound by GAM1700 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1700 target proteins.

[23678] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1700 gene, herein designated GAM GENE, on one or more GAM1700 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23679] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1700 correlate with, and may be deduced from, the identity of the target

genes which GAM1700 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23680] Nucleotide sequences of the GAM1700 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1700 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1700 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1700 are further described hereinbelow with reference to Table 1.

[23681] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1700 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23682] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1701 (GAM1701) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23683] GAM1701 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1701 was detected is described hereinabove with reference to Figs. 2-8.

[23684] GAM1701 gene, herein designated GAM GENE, and GAM1701 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[23685] GAM1701 gene, herein designated GAM GENE, encodes a GAM1701 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1701 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1701 precursor RNA is designated SEQ ID:1678, and is provided hereinbelow with reference to the sequence listing part.

[23686] GAM1701 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1701 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23687] An enzyme complex designated DICER COMPLEX, dices the GAM1701 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1701 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM1701 RNA is designated SEQ ID:4283, and is provided

hereinbelow with reference to the sequence listing part.

[23688] GAM1701 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1701 target RNA, herein designated GAM TARGET RNA. GAM1701 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23689] GAM1701 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1701 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1701 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1701 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1701 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23690] The complementary binding of GAM1701 RNA, herein designated GAM RNA, to target binding sites on GAM1701 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1701 target RNA, herein designated GAM TARGET RNA, into GAM1701 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23691] It is appreciated that GAM1701 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1701 target genes. The mRNA of each one of this plurality of GAM1701 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1701 RNA, herein designated GAM RNA, and which when bound by GAM1701 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1701 target proteins.

[23692] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1701 gene, herein designated GAM GENE, on one or more GAM1701 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23693] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1701 correlate with, and may be deduced from, the identity of the target genes which GAM1701 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23694] Nucleotide sequences of the GAM1701 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1701 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1701 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1701 are further described hereinbelow with reference to Table 1.

[23695] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1701 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23696] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1702 (GAM1702) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23697] GAM1702 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1702 was detected is described hereinabove with reference to Figs. 2-8.

[23698] GAM1702 gene, herein designated GAM GENE, and GAM1702 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23699] GAM1702 gene, herein designated GAM GENE, encodes a GAM1702 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1702 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1702 precursor RNA is designated SEQ ID:1679, and is provided hereinbelow with reference to the sequence listing part.

[23700] GAM1702 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1702 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23701] An enzyme complex designated DICER COMPLEX, dices the GAM1702 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1702 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM1702 RNA is designated SEQ ID:4284, and is provided hereinbelow with reference to the sequence listing part.

[23702] GAM1702 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1702 target RNA, herein designated GAM TARGET RNA. GAM1702 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23703] GAM1702 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1702 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1702 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1702 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1702 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23704] The complementary binding of GAM1702 RNA, herein designated GAM RNA, to target binding sites on GAM1702 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1702 target RNA, herein designated GAM TARGET RNA, into GAM1702 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23705] It is appreciated that GAM1702 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1702 target genes. The mRNA of each one of this plurality of GAM1702 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1702 RNA, herein designated GAM RNA, and which when bound by GAM1702 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1702 target proteins.

[23706] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1702 gene, herein designated GAM GENE, on one or more GAM1702 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23707] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1702 correlate with, and may be deduced from, the identity of the target genes which GAM1702 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23708] Nucleotide sequences of the GAM1702 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1702 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1702 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1702 are further described hereinbelow with reference to Table 1.

[23709] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1702 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23710] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1703 (GAM1703) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23711] GAM1703 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1703 was detected is described hereinabove with reference to Figs. 2-8.

[23712] GAM1703 gene, herein designated GAM GENE, and GAM1703 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23713] GAM1703 gene, herein designated GAM GENE, encodes a GAM1703 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1703 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1703 precursor RNA is designated SEQ ID:1680, and is provided hereinbelow with reference to the sequence listing part.

[23714] GAM1703 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1703 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23715] An enzyme complex designated DICER COMPLEX, dices the GAM1703 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1703 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1703 RNA is designated SEQ ID:4285, and is provided hereinbelow with reference to the sequence listing part.

[23716] GAM1703 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1703 target RNA, herein designated GAM TARGET RNA. GAM1703 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23717] GAM1703 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1703 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1703 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1703 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1703 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23718] The complementary binding of GAM1703 RNA, herein designated GAM RNA, to target binding sites on GAM1703 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1703 target RNA, herein designated GAM TARGET RNA, into GAM1703 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23719] It is appreciated that GAM1703 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1703 target genes. The mRNA of each one of this plurality of GAM1703 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1703 RNA, herein designated GAM RNA, and which when bound by GAM1703 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1703 target proteins.

[23720] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1703 gene, herein designated GAM GENE, on one or more GAM1703 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23721] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1703 correlate with, and may be deduced from, the identity of the target genes which GAM1703 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23722] Nucleotide sequences of the GAM1703 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1703 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1703 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1703 are further described hereinbelow with reference to Table 1.

[23723] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1703 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[23724] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1704 (GAM1704) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23725] GAM1704 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1704 was detected is described hereinabove with reference to Figs. 2-8.

[23726] GAM1704 gene, herein designated GAM GENE, and GAM1704 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23727] GAM1704 gene, herein designated GAM GENE, encodes a GAM1704 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1704 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1704 precursor RNA is designated SEQ ID:1681, and is provided hereinbelow with reference to the sequence listing part.

[23728] GAM1704 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1704 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23729] An enzyme complex designated DICER COMPLEX, dices the GAM1704 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1704 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1704 RNA is designated SEQ ID:4287, and is provided hereinbelow with reference to the sequence listing part.

[23730] GAM1704 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1704 target RNA, herein designated GAM TARGET RNA. GAM1704 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23731] GAM1704 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1704 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1704 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1704 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1704 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23732] The complementary binding of GAM1704 RNA, herein designated GAM RNA, to target binding sites on GAM1704 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1704 target RNA, herein designated GAM TARGET RNA, into GAM1704 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23733] It is appreciated that GAM1704 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1704 target genes. The mRNA of each one of this plurality of GAM1704 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1704 RNA, herein designated GAM RNA, and which when bound by GAM1704 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1704 target proteins.

[23734] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1704 gene, herein designated GAM GENE, on one or more GAM1704 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23735] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1704 correlate with, and may be deduced from, the identity of the target genes which GAM1704 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23736] Nucleotide sequences of the GAM1704 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1704 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1704 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1704 are further described hereinbelow with reference to Table 1.

[23737] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1704 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23738] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1705 (GAM1705) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23739] GAM1705 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1705 was detected is described hereinabove with reference to Figs. 2-8.

[23740] GAM1705 gene, herein designated GAM GENE, and GAM1705 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23741] GAM1705 gene, herein designated GAM GENE, encodes a GAM1705 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1705 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1705 precursor RNA is designated SEQ ID:1682, and is provided hereinbelow with reference to the sequence listing part.

[23742] GAM1705 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1705 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23743] An enzyme complex designated DICER COMPLEX, dices the GAM1705 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1705 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1705 RNA is designated SEQ ID:4286, and is provided hereinbelow with reference to the sequence listing part.

[23744] GAM1705 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1705 target RNA, herein designated GAM TARGET RNA. GAM1705 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23745] GAM1705 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1705 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1705 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1705 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1705 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23746] The complementary binding of GAM1705 RNA, herein designated GAM RNA, to target binding sites on GAM1705 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1705 target RNA, herein designated GAM TARGET RNA, into GAM1705 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23747] It is appreciated that GAM1705 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1705 target genes. The

mRNA of each one of this plurality of GAM1705 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1705 RNA, herein designated GAM RNA, and which when bound by GAM1705 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1705 target proteins.

[23748] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1705 gene, herein designated GAM GENE, on one or more GAM1705 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23749] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1705 correlate with, and may be deduced from, the identity of the target genes which GAM1705 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23750] Nucleotide sequences of the GAM1705 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1705 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1705 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1705 are further described hereinbelow with reference to Table 1.

[23751] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1705 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23752] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1706 (GAM1706) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23753] GAM1706 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1706 was detected is described hereinabove with reference to Figs. 2-8.

[23754] GAM1706 gene, herein designated GAM GENE, and GAM1706 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23755] GAM1706 gene, herein designated GAM GENE, encodes a GAM1706 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1706 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1706 precursor RNA is designated SEQ ID:1683, and is provided hereinbelow with reference to the sequence listing part.

[23756] GAM1706 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1706 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23757] An enzyme complex designated DICER COMPLEX, dices the GAM1706 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1706 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1706 RNA is designated SEQ ID:4288, and is provided hereinbelow with reference to the sequence listing part.

[23758] GAM1706 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1706 target RNA, herein designated GAM TARGET RNA. GAM1706 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23759] GAM1706 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1706 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1706 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1706 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1706 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23760] The complementary binding of GAM1706 RNA, herein designated GAM RNA, to target binding sites on GAM1706 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1706 target RNA, herein designated GAM TARGET RNA, into GAM1706 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23761] It is appreciated that GAM1706 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1706 target genes. The mRNA of each one of this plurality of GAM1706 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1706 RNA, herein designated GAM RNA, and which when bound by GAM1706 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1706 target proteins.

[23762] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1706 gene, herein designated GAM GENE, on one or more GAM1706 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23763] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1706 correlate with, and may be deduced from, the identity of the target

genes which GAM1706 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23764] Nucleotide sequences of the GAM1706 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1706 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1706 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1706 are further described hereinbelow with reference to Table 1.

[23765] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1706 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23766] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1707 (GAM1707) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23767] GAM1707 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1707 was detected is described hereinabove with reference to Figs. 2-8.

[23768] GAM1707 gene, herein designated GAM GENE, and GAM1707 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[23769] GAM1707 gene, herein designated GAM GENE, encodes a GAM1707 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1707 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1707 precursor RNA is designated SEQ ID:1684, and is provided hereinbelow with reference to the sequence listing part.

[23770] GAM1707 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23771] An enzyme complex designated DICER COMPLEX, dices the GAM1707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1707 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1707 RNA is designated SEQ ID:4289, and is provided

hereinbelow with reference to the sequence listing part.

[23772] GAM1707 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1707 target RNA, herein designated GAM TARGET RNA. GAM1707 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23773] GAM1707 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1707 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1707 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1707 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1707 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23774] The complementary binding of GAM1707 RNA, herein designated GAM RNA, to target binding sites on GAM1707 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1707 target RNA, herein designated GAM TARGET RNA, into GAM1707 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23775] It is appreciated that GAM1707 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1707 target genes. The mRNA of each one of this plurality of GAM1707 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1707 RNA, herein designated GAM RNA, and which when bound by GAM1707 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1707 target proteins.

[23776] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1707 gene, herein designated GAM GENE, on one or more GAM1707 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23777] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1707 correlate with, and may be deduced from, the identity of the target genes which GAM1707 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23778] Nucleotide sequences of the GAM1707 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1707 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1707 are further described hereinbelow with reference to Table 1.

[23779] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1707 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23780] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1708 (GAM1708) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23781] GAM1708 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1708 was detected is described hereinabove with reference to Figs. 2-8.

[23782] GAM1708 gene, herein designated GAM GENE, and GAM1708 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23783] GAM1708 gene, herein designated GAM GENE, encodes a GAM1708 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1708 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1708 precursor RNA is designated SEQ ID:1685, and is provided hereinbelow with reference to the sequence listing part.

[23784] GAM1708 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1708 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23785] An enzyme complex designated DICER COMPLEX, dices the GAM1708 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1708 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1708 RNA is designated SEQ ID:4291, and is provided hereinbelow with reference to the sequence listing part.

[23786] GAM1708 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1708 target RNA, herein designated GAM TARGET RNA. GAM1708 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23787] GAM1708 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1708 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1708 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1708 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1708 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23788] The complementary binding of GAM1708 RNA, herein designated GAM RNA, to target binding sites on GAM1708 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1708 target RNA, herein designated GAM TARGET RNA, into GAM1708 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23789] It is appreciated that GAM1708 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1708 target genes. The mRNA of each one of this plurality of GAM1708 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1708 RNA, herein designated GAM RNA, and which when bound by GAM1708 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1708 target proteins.

[23790] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1708 gene, herein designated GAM GENE, on one or more GAM1708 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23791] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1708 correlate with, and may be deduced from, the identity of the target genes which GAM1708 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23792] Nucleotide sequences of the GAM1708 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1708 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1708 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1708 are further described hereinbelow with reference to Table 1.

[23793] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1708 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23794] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1709 (GAM1709) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23795] GAM1709 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1709 was detected is described hereinabove with reference to Figs. 2-8.

[23796] GAM1709 gene, herein designated GAM GENE, and GAM1709 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23797] GAM1709 gene, herein designated GAM GENE, encodes a GAM1709 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1709 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1709 precursor RNA is designated SEQ ID:1686, and is provided hereinbelow with reference to the sequence listing part.

[23798] GAM1709 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1709 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23799] An enzyme complex designated DICER COMPLEX, dices the GAM1709 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1709 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1709 RNA is designated SEQ ID:4290, and is provided hereinbelow with reference to the sequence listing part.

[23800] GAM1709 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1709 target RNA, herein designated GAM TARGET RNA. GAM1709 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23801] GAM1709 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1709 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1709 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1709 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1709 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23802] The complementary binding of GAM1709 RNA, herein designated GAM RNA, to target binding sites on GAM1709 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1709 target RNA, herein designated GAM TARGET RNA, into GAM1709 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23803] It is appreciated that GAM1709 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1709 target genes. The mRNA of each one of this plurality of GAM1709 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1709 RNA, herein designated GAM RNA, and which when bound by GAM1709 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1709 target proteins.

[23804] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1709 gene, herein designated GAM GENE, on one or more GAM1709 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23805] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1709 correlate with, and may be deduced from, the identity of the target genes which GAM1709 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23806] Nucleotide sequences of the GAM1709 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1709 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1709 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1709 are further described hereinbelow with reference to Table 1.

[23807] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1709 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[23808] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1710 (GAM1710) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23809] GAM1710 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1710 was detected is described hereinabove with reference to Figs. 2-8.

[23810] GAM1710 gene, herein designated GAM GENE, and GAM1710 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23811] GAM1710 gene, herein designated GAM GENE, encodes a GAM1710 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1710 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1710 precursor RNA is designated SEQ ID:1687, and is provided hereinbelow with reference to the sequence listing part.

[23812] GAM1710 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1710 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23813] An enzyme complex designated DICER COMPLEX, dices the GAM1710 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1710 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1710 RNA is designated SEQ ID:4292, and is provided hereinbelow with reference to the sequence listing part.

[23814] GAM1710 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1710 target RNA, herein designated GAM TARGET RNA. GAM1710 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23815] GAM1710 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1710 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1710 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1710 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1710 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23816] The complementary binding of GAM1710 RNA, herein designated GAM RNA, to target binding sites on GAM1710 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1710 target RNA, herein designated GAM TARGET RNA, into GAM1710 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23817] It is appreciated that GAM1710 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1710 target genes. The mRNA of each one of this plurality of GAM1710 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1710 RNA, herein designated GAM RNA, and which when bound by GAM1710 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1710 target proteins.

[23818] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1710 gene, herein designated GAM GENE, on one or more GAM1710 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23819] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1710 correlate with, and may be deduced from, the identity of the target genes which GAM1710 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23820] Nucleotide sequences of the GAM1710 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1710 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1710 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1710 are further described hereinbelow with reference to Table 1.

[23821] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1710 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23822] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1711 (GAM1711) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23823] GAM1711 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1711 was detected is described hereinabove with reference to Figs. 2-8.

[23824] GAM1711 gene, herein designated GAM GENE, and GAM1711 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23825] GAM1711 gene, herein designated GAM GENE, encodes a GAM1711 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1711 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1711 precursor RNA is designated SEQ ID:1688, and is provided hereinbelow with reference to the sequence listing part.

[23826] GAM1711 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1711 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23827] An enzyme complex designated DICER COMPLEX, dices the GAM1711 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1711 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1711 RNA is designated SEQ ID:4293, and is provided hereinbelow with reference to the sequence listing part.

[23828] GAM1711 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1711 target RNA, herein designated GAM TARGET RNA. GAM1711 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23829] GAM1711 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1711 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1711 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1711 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1711 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23830] The complementary binding of GAM1711 RNA, herein designated GAM RNA, to target binding sites on GAM1711 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1711 target RNA, herein designated GAM TARGET RNA, into GAM1711 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23831] It is appreciated that GAM1711 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1711 target genes. The

mRNA of each one of this plurality of GAM1711 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1711 RNA, herein designated GAM RNA, and which when bound by GAM1711 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1711 target proteins.

[23832] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1711 gene, herein designated GAM GENE, on one or more GAM1711 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23833] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1711 correlate with, and may be deduced from, the identity of the target genes which GAM1711 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23834] Nucleotide sequences of the GAM1711 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1711 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1711 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1711 are further described hereinbelow with reference to Table 1.

[23835] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1711 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23836] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1712 (GAM1712) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23837] GAM1712 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1712 was detected is described hereinabove with reference to Figs. 2-8.

[23838] GAM1712 gene, herein designated GAM GENE, and GAM1712 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23839] GAM1712 gene, herein designated GAM GENE, encodes a GAM1712 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1712 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1712 precursor RNA is designated SEQ ID:1689, and is provided hereinbelow with reference to the sequence listing part.

[23840] GAM1712 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1712 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23841] An enzyme complex designated DICER COMPLEX, dices the GAM1712 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1712 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 93%) nucleotide sequence of GAM1712 RNA is designated SEQ ID:4295, and is provided hereinbelow with reference to the sequence listing part.

[23842] GAM1712 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1712 target RNA, herein designated GAM TARGET RNA. GAM1712 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23843] GAM1712 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1712 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1712 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1712 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1712 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23844] The complementary binding of GAM1712 RNA, herein designated GAM RNA, to target binding sites on GAM1712 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1712 target RNA, herein designated GAM TARGET RNA, into GAM1712 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23845] It is appreciated that GAM1712 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1712 target genes. The mRNA of each one of this plurality of GAM1712 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1712 RNA, herein designated GAM RNA, and which when bound by GAM1712 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1712 target proteins.

[23846] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1712 gene, herein designated GAM GENE, on one or more GAM1712 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23847] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1712 correlate with, and may be deduced from, the identity of the target

genes which GAM1712 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23848] Nucleotide sequences of the GAM1712 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1712 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1712 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1712 are further described hereinbelow with reference to Table 1.

[23849] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1712 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23850] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1713 (GAM1713) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23851] GAM1713 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1713 was detected is described hereinabove with reference to Figs. 2-8.

[23852] GAM1713 gene, herein designated GAM GENE, and GAM1713 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[23853] GAM1713 gene, herein designated GAM GENE, encodes a GAM1713 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1713 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1713 precursor RNA is designated SEQ ID:1690, and is provided hereinbelow with reference to the sequence listing part.

[23854] GAM1713 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1713 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23855] An enzyme complex designated DICER COMPLEX, dices the GAM1713 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1713 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1713 RNA is designated SEQ ID:4296, and is provided

hereinbelow with reference to the sequence listing part.

[23856] GAM1713 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1713 target RNA, herein designated GAM TARGET RNA. GAM1713 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23857] GAM1713 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1713 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1713 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1713 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1713 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23858] The complementary binding of GAM1713 RNA, herein designated GAM RNA, to target binding sites on GAM1713 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1713 target RNA, herein designated GAM TARGET RNA, into GAM1713 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23859] It is appreciated that GAM1713 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1713 target genes. The mRNA of each one of this plurality of GAM1713 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1713 RNA, herein designated GAM RNA, and which when bound by GAM1713 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1713 target proteins.

[23860] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1713 gene, herein designated GAM GENE, on one or more GAM1713 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23861] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1713 correlate with, and may be deduced from, the identity of the target genes which GAM1713 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23862] Nucleotide sequences of the GAM1713 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1713 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1713 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1713 are further described hereinbelow with reference to Table 1.

[23863] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1713 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23864] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1714 (GAM1714) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23865] GAM1714 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1714 was detected is described hereinabove with reference to Figs. 2-8.

[23866] GAM1714 gene, herein designated GAM GENE, and GAM1714 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23867] GAM1714 gene, herein designated GAM GENE, encodes a GAM1714 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1714 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1714 precursor RNA is designated SEQ ID:1691, and is provided hereinbelow with reference to the sequence listing part.

[23868] GAM1714 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1714 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23869] An enzyme complex designated DICER COMPLEX, dices the GAM1714 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1714 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1714 RNA is designated SEQ ID:4294, and is provided hereinbelow with reference to the sequence listing part.

[23870] GAM1714 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1714 target RNA, herein designated GAM TARGET RNA. GAM1714 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23871] GAM1714 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1714 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1714 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1714 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1714 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23872] The complementary binding of GAM1714 RNA, herein designated GAM RNA, to target binding sites on GAM1714 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1714 target RNA, herein designated GAM TARGET RNA, into GAM1714 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23873] It is appreciated that GAM1714 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1714 target genes. The mRNA of each one of this plurality of GAM1714 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1714 RNA, herein designated GAM RNA, and which when bound by GAM1714 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1714 target proteins.

[23874] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1714 gene, herein designated GAM GENE, on one or more GAM1714 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23875] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1714 correlate with, and may be deduced from, the identity of the target genes which GAM1714 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23876] Nucleotide sequences of the GAM1714 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1714 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1714 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1714 are further described hereinbelow with reference to Table 1.

[23877] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1714 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23878] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1715 (GAM1715) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23879] GAM1715 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1715 was detected is described hereinabove with reference to Figs. 2-8.

[23880] GAM1715 gene, herein designated GAM GENE, and GAM1715 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23881] GAM1715 gene, herein designated GAM GENE, encodes a GAM1715 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1715 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1715 precursor RNA is designated SEQ ID:1692, and is provided hereinbelow with reference to the sequence listing part.

[23882] GAM1715 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1715 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23883] An enzyme complex designated DICER COMPLEX, dices the GAM1715 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1715 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1715 RNA is designated SEQ ID:4297, and is provided hereinbelow with reference to the sequence listing part.

[23884] GAM1715 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1715 target RNA, herein designated GAM TARGET RNA. GAM1715 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23885] GAM1715 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1715 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1715 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1715 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1715 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23886] The complementary binding of GAM1715 RNA, herein designated GAM RNA, to target binding sites on GAM1715 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1715 target RNA, herein designated GAM TARGET RNA, into GAM1715 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23887] It is appreciated that GAM1715 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1715 target genes. The mRNA of each one of this plurality of GAM1715 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1715 RNA, herein designated GAM RNA, and which when bound by GAM1715 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1715 target proteins.

[23888] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1715 gene, herein designated GAM GENE, on one or more GAM1715 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23889] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1715 correlate with, and may be deduced from, the identity of the target genes which GAM1715 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23890] Nucleotide sequences of the GAM1715 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1715 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1715 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1715 are further described hereinbelow with reference to Table 1.

[23891] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1715 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[23892] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1716 (GAM1716) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23893] GAM1716 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1716 was detected is described hereinabove with reference to Figs. 2-8.

[23894] GAM1716 gene, herein designated GAM GENE, and GAM1716 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23895] GAM1716 gene, herein designated GAM GENE, encodes a GAM1716 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1716 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1716 precursor RNA is designated SEQ ID:1693, and is provided hereinbelow with reference to the sequence listing part.

[23896] GAM1716 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1716 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23897] An enzyme complex designated DICER COMPLEX, dices the GAM1716 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1716 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1716 RNA is designated SEQ ID:4299, and is provided hereinbelow with reference to the sequence listing part.

[23898] GAM1716 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1716 target RNA, herein designated GAM TARGET RNA. GAM1716 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23899] GAM1716 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1716 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1716 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1716 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1716 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23900] The complementary binding of GAM1716 RNA, herein designated GAM RNA, to target binding sites on GAM1716 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1716 target RNA, herein designated GAM TARGET RNA, into GAM1716 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23901] It is appreciated that GAM1716 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1716 target genes. The mRNA of each one of this plurality of GAM1716 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1716 RNA, herein designated GAM RNA, and which when bound by GAM1716 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1716 target proteins.

[23902] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1716 gene, herein designated GAM GENE, on one or more GAM1716 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23903] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1716 correlate with, and may be deduced from, the identity of the target genes which GAM1716 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23904] Nucleotide sequences of the GAM1716 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1716 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1716 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1716 are further described hereinbelow with reference to Table 1.

[23905] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1716 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23906] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1717 (GAM1717) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23907] GAM1717 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1717 was detected is described hereinabove with reference to Figs. 2-8.

[23908] GAM1717 gene, herein designated GAM GENE, and GAM1717 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23909] GAM1717 gene, herein designated GAM GENE, encodes a GAM1717 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1717 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1717 precursor RNA is designated SEQ ID:1694, and is provided hereinbelow with reference to the sequence listing part.

[23910] GAM1717 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1717 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23911] An enzyme complex designated DICER COMPLEX, dices the GAM1717 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1717 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM1717 RNA is designated SEQ ID:4298, and is provided hereinbelow with reference to the sequence listing part.

[23912] GAM1717 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1717 target RNA, herein designated GAM TARGET RNA. GAM1717 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23913] GAM1717 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1717 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1717 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1717 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1717 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23914] The complementary binding of GAM1717 RNA, herein designated GAM RNA, to target binding sites on GAM1717 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1717 target RNA, herein designated GAM TARGET RNA, into GAM1717 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23915] It is appreciated that GAM1717 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1717 target genes. The

mRNA of each one of this plurality of GAM1717 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1717 RNA, herein designated GAM RNA, and which when bound by GAM1717 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1717 target proteins.

[23916] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1717 gene, herein designated GAM GENE, on one or more GAM1717 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23917] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1717 correlate with, and may be deduced from, the identity of the target genes which GAM1717 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23918] Nucleotide sequences of the GAM1717 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1717 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1717 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1717 are further described hereinbelow with reference to Table 1.

[23919] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1717 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23920] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1718 (GAM1718) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23921] GAM1718 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1718 was detected is described hereinabove with reference to Figs. 2-8.

[23922] GAM1718 gene, herein designated GAM GENE, and GAM1718 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23923] GAM1718 gene, herein designated GAM GENE, encodes a GAM1718 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1718 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1718 precursor RNA is designated SEQ ID:1695, and is provided hereinbelow with reference to the sequence listing part.

[23924] GAM1718 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1718 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23925] An enzyme complex designated DICER COMPLEX, dices the GAM1718 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1718 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM1718 RNA is designated SEQ ID:4301, and is provided hereinbelow with reference to the sequence listing part.

[23926] GAM1718 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1718 target RNA, herein designated GAM TARGET RNA. GAM1718 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23927] GAM1718 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1718 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1718 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1718 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1718 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23928] The complementary binding of GAM1718 RNA, herein designated GAM RNA, to target binding sites on GAM1718 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1718 target RNA, herein designated GAM TARGET RNA, into GAM1718 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23929] It is appreciated that GAM1718 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1718 target genes. The mRNA of each one of this plurality of GAM1718 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1718 RNA, herein designated GAM RNA, and which when bound by GAM1718 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1718 target proteins.

[23930] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1718 gene, herein designated GAM GENE, on one or more GAM1718 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23931] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1718 correlate with, and may be deduced from, the identity of the target

genes which GAM1718 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23932] Nucleotide sequences of the GAM1718 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1718 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1718 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1718 are further described hereinbelow with reference to Table 1.

[23933] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1718 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23934] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1719 (GAM1719) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23935] GAM1719 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1719 was detected is described hereinabove with reference to Figs. 2-8.

[23936] GAM1719 gene, herein designated GAM GENE, and GAM1719 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[23937] GAM1719 gene, herein designated GAM GENE, encodes a GAM1719 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1719 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1719 precursor RNA is designated SEQ ID:1696, and is provided hereinbelow with reference to the sequence listing part.

[23938] GAM1719 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1719 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23939] An enzyme complex designated DICER COMPLEX, dices the GAM1719 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1719 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1719 RNA is designated SEQ ID:4300, and is provided

hereinbelow with reference to the sequence listing part.

[23940] GAM1719 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1719 target RNA, herein designated GAM TARGET RNA. GAM1719 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23941] GAM1719 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1719 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1719 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1719 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1719 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23942] The complementary binding of GAM1719 RNA, herein designated GAM RNA, to target binding sites on GAM1719 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1719 target RNA, herein designated GAM TARGET RNA, into GAM1719 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23943] It is appreciated that GAM1719 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1719 target genes. The mRNA of each one of this plurality of GAM1719 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1719 RNA, herein designated GAM RNA, and which when bound by GAM1719 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1719 target proteins.

[23944] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1719 gene, herein designated GAM GENE, on one or more GAM1719 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23945] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1719 correlate with, and may be deduced from, the identity of the target genes which GAM1719 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23946] Nucleotide sequences of the GAM1719 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1719 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1719 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1719 are further described hereinbelow with reference to Table 1.

[23947] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1719 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23948] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1720 (GAM1720) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23949] GAM1720 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1720 was detected is described hereinabove with reference to Figs. 2-8.

[23950] GAM1720 gene, herein designated GAM GENE, and GAM1720 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23951] GAM1720 gene, herein designated GAM GENE, encodes a GAM1720 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1720 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1720 precursor RNA is designated SEQ ID:1697, and is provided hereinbelow with reference to the sequence listing part.

[23952] GAM1720 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1720 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23953] An enzyme complex designated DICER COMPLEX, dices the GAM1720 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1720 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1720 RNA is designated SEQ ID:4302, and is provided hereinbelow with reference to the sequence listing part.

[23954] GAM1720 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1720 target RNA, herein designated GAM TARGET RNA. GAM1720 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23955] GAM1720 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1720 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1720 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1720 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1720 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23956] The complementary binding of GAM1720 RNA, herein designated GAM RNA, to target binding sites on GAM1720 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1720 target RNA, herein designated GAM TARGET RNA, into GAM1720 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23957] It is appreciated that GAM1720 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1720 target genes. The mRNA of each one of this plurality of GAM1720 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1720 RNA, herein designated GAM RNA, and which when bound by GAM1720 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1720 target proteins.

[23958] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1720 gene, herein designated GAM GENE, on one or more GAM1720 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23959] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1720 correlate with, and may be deduced from, the identity of the target genes which GAM1720 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23960] Nucleotide sequences of the GAM1720 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1720 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1720 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1720 are further described hereinbelow with reference to Table 1.

[23961] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1720 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23962] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1721 (GAM1721) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23963] GAM1721 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1721 was detected is described hereinabove with reference to Figs. 2-8.

[23964] GAM1721 gene, herein designated GAM GENE, and GAM1721 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23965] GAM1721 gene, herein designated GAM GENE, encodes a GAM1721 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1721 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1721 precursor RNA is designated SEQ ID:1698, and is provided hereinbelow with reference to the sequence listing part.

[23966] GAM1721 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1721 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23967] An enzyme complex designated DICER COMPLEX, dices the GAM1721 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1721 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1721 RNA is designated SEQ ID:4303, and is provided hereinbelow with reference to the sequence listing part.

[23968] GAM1721 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1721 target RNA, herein designated GAM TARGET RNA. GAM1721 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23969] GAM1721 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1721 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1721 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1721 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1721 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23970] The complementary binding of GAM1721 RNA, herein designated GAM RNA, to target binding sites on GAM1721 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1721 target RNA, herein designated GAM TARGET RNA, into GAM1721 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23971] It is appreciated that GAM1721 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1721 target genes. The mRNA of each one of this plurality of GAM1721 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1721 RNA, herein designated GAM RNA, and which when bound by GAM1721 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1721 target proteins.

[23972] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1721 gene, herein designated GAM GENE, on one or more GAM1721 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23973] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1721 correlate with, and may be deduced from, the identity of the target genes which GAM1721 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23974] Nucleotide sequences of the GAM1721 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1721 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1721 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1721 are further described hereinbelow with reference to Table 1.

[23975] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1721 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[23976] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1722 (GAM1722) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23977] GAM1722 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1722 was detected is described hereinabove with reference to Figs. 2-8.

[23978] GAM1722 gene, herein designated GAM GENE, and GAM1722 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23979] GAM1722 gene, herein designated GAM GENE, encodes a GAM1722 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1722 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1722 precursor RNA is designated SEQ ID:1699, and is provided hereinbelow with reference to the sequence listing part.

[23980] GAM1722 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1722 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23981] An enzyme complex designated DICER COMPLEX, dices the GAM1722 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1722 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1722 RNA is designated SEQ ID:4304, and is provided hereinbelow with reference to the sequence listing part.

[23982] GAM1722 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1722 target RNA, herein designated GAM TARGET RNA. GAM1722 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23983] GAM1722 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1722 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1722 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1722 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1722 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23984] The complementary binding of GAM1722 RNA, herein designated GAM RNA, to target binding sites on GAM1722 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1722 target RNA, herein designated GAM TARGET RNA, into GAM1722 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23985] It is appreciated that GAM1722 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1722 target genes. The mRNA of each one of this plurality of GAM1722 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1722 RNA, herein designated GAM RNA, and which when bound by GAM1722 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1722 target proteins.

[23986] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1722 gene, herein designated GAM GENE, on one or more GAM1722 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[23987] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1722 correlate with, and may be deduced from, the identity of the target genes which GAM1722 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23988] Nucleotide sequences of the GAM1722 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1722 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1722 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1722 are further described hereinbelow with reference to Table 1.

[23989] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1722 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[23990] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1723 (GAM1723) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[23991] GAM1723 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1723 was detected is described hereinabove with reference to Figs. 2-8.

[23992] GAM1723 gene, herein designated GAM GENE, and GAM1723 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[23993] GAM1723 gene, herein designated GAM GENE, encodes a GAM1723 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1723 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1723 precursor RNA is designated SEQ ID:1700, and is provided hereinbelow with reference to the sequence listing part.

[23994] GAM1723 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1723 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23995] An enzyme complex designated DICER COMPLEX, dices the GAM1723 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1723 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1723 RNA is designated SEQ ID:4306, and is provided hereinbelow with reference to the sequence listing part.

[23996] GAM1723 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1723 target RNA, herein designated GAM TARGET RNA. GAM1723 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[23997] GAM1723 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1723 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1723 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1723 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1723 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[23998] The complementary binding of GAM1723 RNA, herein designated GAM RNA, to target binding sites on GAM1723 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1723 target RNA, herein designated GAM TARGET RNA, into GAM1723 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[23999] It is appreciated that GAM1723 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1723 target genes. The

mRNA of each one of this plurality of GAM1723 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1723 RNA, herein designated GAM RNA, and which when bound by GAM1723 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1723 target proteins.

[24000] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1723 gene, herein designated GAM GENE, on one or more GAM1723 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24001] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1723 correlate with, and may be deduced from, the identity of the target genes which GAM1723 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24002] Nucleotide sequences of the GAM1723 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1723 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1723 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1723 are further described hereinbelow with reference to Table 1.

[24003] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1723 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24004] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1724 (GAM1724) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24005] GAM1724 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1724 was detected is described hereinabove with reference to Figs. 2-8.

[24006] GAM1724 gene, herein designated GAM GENE, and GAM1724 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24007] GAM1724 gene, herein designated GAM GENE, encodes a GAM1724 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1724 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1724 precursor RNA is designated SEQ ID:1701, and is provided hereinbelow with reference to the sequence listing part.

[24008] GAM1724 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1724 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24009] An enzyme complex designated DICER COMPLEX, dices the GAM1724 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1724 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1724 RNA is designated SEQ ID:4305, and is provided hereinbelow with reference to the sequence listing part.

[24010] GAM1724 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1724 target RNA, herein designated GAM TARGET RNA. GAM1724 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24011] GAM1724 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1724 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1724 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1724 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1724 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24012] The complementary binding of GAM1724 RNA, herein designated GAM RNA, to target binding sites on GAM1724 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1724 target RNA, herein designated GAM TARGET RNA, into GAM1724 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24013] It is appreciated that GAM1724 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1724 target genes. The mRNA of each one of this plurality of GAM1724 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1724 RNA, herein designated GAM RNA, and which when bound by GAM1724 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1724 target proteins.

[24014] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1724 gene, herein designated GAM GENE, on one or more GAM1724 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24015] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1724 correlate with, and may be deduced from, the identity of the target

genes which GAM1724 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24016] Nucleotide sequences of the GAM1724 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1724 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1724 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1724 are further described hereinbelow with reference to Table 1.

[24017] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1724 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24018] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1725 (GAM1725) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24019] GAM1725 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1725 was detected is described hereinabove with reference to Figs. 2-8.

[24020] GAM1725 gene, herein designated GAM GENE, and GAM1725 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[24021] GAM1725 gene, herein designated GAM GENE, encodes a GAM1725 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1725 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1725 precursor RNA is designated SEQ ID:1702, and is provided hereinbelow with reference to the sequence listing part.

[24022] GAM1725 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1725 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24023] An enzyme complex designated DICER COMPLEX, dices the GAM1725 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1725 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1725 RNA is designated SEQ ID:4307, and is provided

hereinbelow with reference to the sequence listing part.

[24024] GAM1725 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1725 target RNA, herein designated GAM TARGET RNA. GAM1725 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24025] GAM1725 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1725 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1725 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1725 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1725 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24026] The complementary binding of GAM1725 RNA, herein designated GAM RNA, to target binding sites on GAM1725 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1725 target RNA, herein designated GAM TARGET RNA, into GAM1725 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24027] It is appreciated that GAM1725 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1725 target genes. The mRNA of each one of this plurality of GAM1725 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1725 RNA, herein designated GAM RNA, and which when bound by GAM1725 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1725 target proteins.

[24028] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1725 gene, herein designated GAM GENE, on one or more GAM1725 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24029] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1725 correlate with, and may be deduced from, the identity of the target genes which GAM1725 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24030] Nucleotide sequences of the GAM1725 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1725 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1725 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1725 are further described hereinbelow with reference to Table 1.

[24031] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1725 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24032] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1726 (GAM1726) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24033] GAM1726 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1726 was detected is described hereinabove with reference to Figs. 2-8.

[24034] GAM1726 gene, herein designated GAM GENE, and GAM1726 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24035] GAM1726 gene, herein designated GAM GENE, encodes a GAM1726 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1726 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1726 precursor RNA is designated SEQ ID:1703, and is provided hereinbelow with reference to the sequence listing part.

[24036] GAM1726 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1726 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24037] An enzyme complex designated DICER COMPLEX, dices the GAM1726 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1726 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1726 RNA is designated SEQ ID:4308, and is provided hereinbelow with reference to the sequence listing part.

[24038] GAM1726 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1726 target RNA, herein designated GAM TARGET RNA. GAM1726 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24039] GAM1726 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1726 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1726 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1726 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1726 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24040] The complementary binding of GAM1726 RNA, herein designated GAM RNA, to target binding sites on GAM1726 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1726 target RNA, herein designated GAM TARGET RNA, into GAM1726 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24041] It is appreciated that GAM1726 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1726 target genes. The mRNA of each one of this plurality of GAM1726 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1726 RNA, herein designated GAM RNA, and which when bound by GAM1726 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1726 target proteins.

[24042] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1726 gene, herein designated GAM GENE, on one or more GAM1726 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24043] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1726 correlate with, and may be deduced from, the identity of the target genes which GAM1726 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24044] Nucleotide sequences of the GAM1726 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1726 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1726 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1726 are further described hereinbelow with reference to Table 1.

[24045] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1726 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24046] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1727 (GAM1727) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24047] GAM1727 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1727 was detected is described hereinabove with reference to Figs. 2-8.

[24048] GAM1727 gene, herein designated GAM GENE, and GAM1727 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24049] GAM1727 gene, herein designated GAM GENE, encodes a GAM1727 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1727 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1727 precursor RNA is designated SEQ ID:1704, and is provided hereinbelow with reference to the sequence listing part.

[24050] GAM1727 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1727 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24051] An enzyme complex designated DICER COMPLEX, dices the GAM1727 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1727 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM1727 RNA is designated SEQ ID:4309, and is provided hereinbelow with reference to the sequence listing part.

[24052] GAM1727 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1727 target RNA, herein designated GAM TARGET RNA. GAM1727 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24053] GAM1727 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1727 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1727 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1727 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1727 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24054] The complementary binding of GAM1727 RNA, herein designated GAM RNA, to target binding sites on GAM1727 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1727 target RNA, herein designated GAM TARGET RNA, into GAM1727 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24055] It is appreciated that GAM1727 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1727 target genes. The mRNA of each one of this plurality of GAM1727 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1727 RNA, herein designated GAM RNA, and which when bound by GAM1727 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1727 target proteins.

[24056] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1727 gene, herein designated GAM GENE, on one or more GAM1727 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24057] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1727 correlate with, and may be deduced from, the identity of the target genes which GAM1727 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24058] Nucleotide sequences of the GAM1727 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1727 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1727 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1727 are further described hereinbelow with reference to Table 1.

[24059] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1727 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[24060] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1728 (GAM1728) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24061] GAM1728 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1728 was detected is described hereinabove with reference to Figs. 2-8.

[24062] GAM1728 gene, herein designated GAM GENE, and GAM1728 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24063] GAM1728 gene, herein designated GAM GENE, encodes a GAM1728 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1728 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1728 precursor RNA is designated SEQ ID:1705, and is provided hereinbelow with reference to the sequence listing part.

[24064] GAM1728 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1728 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24065] An enzyme complex designated DICER COMPLEX, dices the GAM1728 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1728 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1728 RNA is designated SEQ ID:4310, and is provided hereinbelow with reference to the sequence listing part.

[24066] GAM1728 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1728 target RNA, herein designated GAM TARGET RNA. GAM1728 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24067] GAM1728 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1728 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1728 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1728 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1728 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24068] The complementary binding of GAM1728 RNA, herein designated GAM RNA, to target binding sites on GAM1728 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1728 target RNA, herein designated GAM TARGET RNA, into GAM1728 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24069] It is appreciated that GAM1728 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1728 target genes. The mRNA of each one of this plurality of GAM1728 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1728 RNA, herein designated GAM RNA, and which when bound by GAM1728 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1728 target proteins.

[24070] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1728 gene, herein designated GAM GENE, on one or more GAM1728 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24071] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1728 correlate with, and may be deduced from, the identity of the target genes which GAM1728 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24072] Nucleotide sequences of the GAM1728 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1728 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1728 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1728 are further described hereinbelow with reference to Table 1.

[24073] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1728 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24074] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1729 (GAM1729) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24075] GAM1729 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1729 was detected is described hereinabove with reference to Figs. 2-8.

[24076] GAM1729 gene, herein designated GAM GENE, and GAM1729 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24077] GAM1729 gene, herein designated GAM GENE, encodes a GAM1729 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1729 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1729 precursor RNA is designated SEQ ID:1706, and is provided hereinbelow with reference to the sequence listing part.

[24078] GAM1729 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1729 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24079] An enzyme complex designated DICER COMPLEX, dices the GAM1729 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1729 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1729 RNA is designated SEQ ID:4311, and is provided hereinbelow with reference to the sequence listing part.

[24080] GAM1729 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1729 target RNA, herein designated GAM TARGET RNA. GAM1729 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24081] GAM1729 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1729 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1729 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1729 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1729 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24082] The complementary binding of GAM1729 RNA, herein designated GAM RNA, to target binding sites on GAM1729 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1729 target RNA, herein designated GAM TARGET RNA, into GAM1729 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24083] It is appreciated that GAM1729 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1729 target genes. The

mRNA of each one of this plurality of GAM1729 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1729 RNA, herein designated GAM RNA, and which when bound by GAM1729 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1729 target proteins.

[24084] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1729 gene, herein designated GAM GENE, on one or more GAM1729 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24085] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1729 correlate with, and may be deduced from, the identity of the target genes which GAM1729 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24086] Nucleotide sequences of the GAM1729 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1729 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1729 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1729 are further described hereinbelow with reference to Table 1.

[24087] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1729 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24088] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1730 (GAM1730) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24089] GAM1730 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1730 was detected is described hereinabove with reference to Figs. 2-8.

[24090] GAM1730 gene, herein designated GAM GENE, and GAM1730 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24091] GAM1730 gene, herein designated GAM GENE, encodes a GAM1730 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1730 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1730 precursor RNA is designated SEQ ID:1707, and is provided hereinbelow with reference to the sequence listing part.

[24092] GAM1730 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1730 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24093] An enzyme complex designated DICER COMPLEX, dices the GAM1730 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1730 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1730 RNA is designated SEQ ID:4312, and is provided hereinbelow with reference to the sequence listing part.

[24094] GAM1730 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1730 target RNA, herein designated GAM TARGET RNA. GAM1730 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24095] GAM1730 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1730 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1730 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1730 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1730 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24096] The complementary binding of GAM1730 RNA, herein designated GAM RNA, to target binding sites on GAM1730 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1730 target RNA, herein designated GAM TARGET RNA, into GAM1730 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24097] It is appreciated that GAM1730 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1730 target genes. The mRNA of each one of this plurality of GAM1730 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1730 RNA, herein designated GAM RNA, and which when bound by GAM1730 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1730 target proteins.

[24098] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1730 gene, herein designated GAM GENE, on one or more GAM1730 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24099] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1730 correlate with, and may be deduced from, the identity of the target

genes which GAM1730 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24100] Nucleotide sequences of the GAM1730 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1730 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1730 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1730 are further described hereinbelow with reference to Table 1.

[24101] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1730 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24102] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1731 (GAM1731) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24103] GAM1731 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1731 was detected is described hereinabove with reference to Figs. 2-8.

[24104] GAM1731 gene, herein designated GAM GENE, and GAM1731 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[24105] GAM1731 gene, herein designated GAM GENE, encodes a GAM1731 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1731 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1731 precursor RNA is designated SEQ ID:1708, and is provided hereinbelow with reference to the sequence listing part.

[24106] GAM1731 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1731 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24107] An enzyme complex designated DICER COMPLEX, dices the GAM1731 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1731 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1731 RNA is designated SEQ ID:4313, and is provided

hereinbelow with reference to the sequence listing part.

[24108] GAM1731 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1731 target RNA, herein designated GAM TARGET RNA. GAM1731 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24109] GAM1731 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1731 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1731 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1731 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1731 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24110] The complementary binding of GAM1731 RNA, herein designated GAM RNA, to target binding sites on GAM1731 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1731 target RNA, herein designated GAM TARGET RNA, into GAM1731 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24111] It is appreciated that GAM1731 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1731 target genes. The mRNA of each one of this plurality of GAM1731 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1731 RNA, herein designated GAM RNA, and which when bound by GAM1731 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1731 target proteins.

[24112] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1731 gene, herein designated GAM GENE, on one or more GAM1731 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24113] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1731 correlate with, and may be deduced from, the identity of the target genes which GAM1731 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24114] Nucleotide sequences of the GAM1731 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1731 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1731 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1731 are further described hereinbelow with reference to Table 1.

[24115] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1731 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24116] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1732 (GAM1732) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24117] GAM1732 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1732 was detected is described hereinabove with reference to Figs. 2-8.

[24118] GAM1732 gene, herein designated GAM GENE, and GAM1732 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24119] GAM1732 gene, herein designated GAM GENE, encodes a GAM1732 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1732 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1732 precursor RNA is designated SEQ ID:1709, and is provided hereinbelow with reference to the sequence listing part.

[24120] GAM1732 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1732 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24121] An enzyme complex designated DICER COMPLEX, dices the GAM1732 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1732 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1732 RNA is designated SEQ ID:4314, and is provided hereinbelow with reference to the sequence listing part.

[24122] GAM1732 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1732 target RNA, herein designated GAM TARGET RNA. GAM1732 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24123] GAM1732 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1732 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1732 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1732 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1732 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24124] The complementary binding of GAM1732 RNA, herein designated GAM RNA, to target binding sites on GAM1732 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1732 target RNA, herein designated GAM TARGET RNA, into GAM1732 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24125] It is appreciated that GAM1732 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1732 target genes. The mRNA of each one of this plurality of GAM1732 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1732 RNA, herein designated GAM RNA, and which when bound by GAM1732 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1732 target proteins.

[24126] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1732 gene, herein designated GAM GENE, on one or more GAM1732 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24127] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1732 correlate with, and may be deduced from, the identity of the target genes which GAM1732 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24128] Nucleotide sequences of the GAM1732 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1732 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1732 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1732 are further described hereinbelow with reference to Table 1.

[24129] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1732 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24130] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1733 (GAM1733) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24131] GAM1733 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1733 was detected is described hereinabove with reference to Figs. 2-8.

[24132] GAM1733 gene, herein designated GAM GENE, and GAM1733 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24133] GAM1733 gene, herein designated GAM GENE, encodes a GAM1733 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1733 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1733 precursor RNA is designated SEQ ID:1710, and is provided hereinbelow with reference to the sequence listing part.

[24134] GAM1733 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1733 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24135] An enzyme complex designated DICER COMPLEX, dices the GAM1733 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1733 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1733 RNA is designated SEQ ID:4315, and is provided hereinbelow with reference to the sequence listing part.

[24136] GAM1733 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1733 target RNA, herein designated GAM TARGET RNA. GAM1733 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24137] GAM1733 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1733 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1733 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1733 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1733 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24138] The complementary binding of GAM1733 RNA, herein designated GAM RNA, to target binding sites on GAM1733 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1733 target RNA, herein designated GAM TARGET RNA, into GAM1733 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24139] It is appreciated that GAM1733 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1733 target genes. The mRNA of each one of this plurality of GAM1733 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1733 RNA, herein designated GAM RNA, and which when bound by GAM1733 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1733 target proteins.

[24140] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1733 gene, herein designated GAM GENE, on one or more GAM1733 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24141] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1733 correlate with, and may be deduced from, the identity of the target genes which GAM1733 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24142] Nucleotide sequences of the GAM1733 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1733 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1733 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1733 are further described hereinbelow with reference to Table 1.

[24143] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1733 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[24144] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1734 (GAM1734) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24145] GAM1734 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1734 was detected is described hereinabove with reference to Figs. 2-8.

[24146] GAM1734 gene, herein designated GAM GENE, and GAM1734 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24147] GAM1734 gene, herein designated GAM GENE, encodes a GAM1734 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1734 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1734 precursor RNA is designated SEQ ID:1711, and is provided hereinbelow with reference to the sequence listing part.

[24148] GAM1734 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1734 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24149] An enzyme complex designated DICER COMPLEX, dices the GAM1734 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1734 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1734 RNA is designated SEQ ID:4316, and is provided hereinbelow with reference to the sequence listing part.

[24150] GAM1734 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1734 target RNA, herein designated GAM TARGET RNA. GAM1734 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24151] GAM1734 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1734 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1734 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1734 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1734 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24152] The complementary binding of GAM1734 RNA, herein designated GAM RNA, to target binding sites on GAM1734 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1734 target RNA, herein designated GAM TARGET RNA, into GAM1734 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24153] It is appreciated that GAM1734 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1734 target genes. The mRNA of each one of this plurality of GAM1734 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1734 RNA, herein designated GAM RNA, and which when bound by GAM1734 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1734 target proteins.

[24154] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1734 gene, herein designated GAM GENE, on one or more GAM1734 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24155] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1734 correlate with, and may be deduced from, the identity of the target genes which GAM1734 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24156] Nucleotide sequences of the GAM1734 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1734 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1734 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1734 are further described hereinbelow with reference to Table 1.

[24157] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1734 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24158] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1735 (GAM1735) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24159] GAM1735 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1735 was detected is described hereinabove with reference to Figs. 2-8.

[24160] GAM1735 gene, herein designated GAM GENE, and GAM1735 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24161] GAM1735 gene, herein designated GAM GENE, encodes a GAM1735 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1735 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1735 precursor RNA is designated SEQ ID:1712, and is provided hereinbelow with reference to the sequence listing part.

[24162] GAM1735 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1735 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24163] An enzyme complex designated DICER COMPLEX, dices the GAM1735 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1735 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1735 RNA is designated SEQ ID:4317, and is provided hereinbelow with reference to the sequence listing part.

[24164] GAM1735 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1735 target RNA, herein designated GAM TARGET RNA. GAM1735 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24165] GAM1735 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1735 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1735 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1735 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1735 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24166] The complementary binding of GAM1735 RNA, herein designated GAM RNA, to target binding sites on GAM1735 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1735 target RNA, herein designated GAM TARGET RNA, into GAM1735 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24167] It is appreciated that GAM1735 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1735 target genes. The

mRNA of each one of this plurality of GAM1735 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1735 RNA, herein designated GAM RNA, and which when bound by GAM1735 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1735 target proteins.

[24168] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1735 gene, herein designated GAM GENE, on one or more GAM1735 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24169] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1735 correlate with, and may be deduced from, the identity of the target genes which GAM1735 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24170] Nucleotide sequences of the GAM1735 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1735 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1735 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1735 are further described hereinbelow with reference to Table 1.

[24171] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1735 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24172] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1736 (GAM1736) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24173] GAM1736 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1736 was detected is described hereinabove with reference to Figs. 2-8.

[24174] GAM1736 gene, herein designated GAM GENE, and GAM1736 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24175] GAM1736 gene, herein designated GAM GENE, encodes a GAM1736 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1736 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1736 precursor RNA is designated SEQ ID:1713, and is provided hereinbelow with reference to the sequence listing part.

[24176] GAM1736 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1736 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24177] An enzyme complex designated DICER COMPLEX, dices the GAM1736 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1736 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1736 RNA is designated SEQ ID:4318, and is provided hereinbelow with reference to the sequence listing part.

[24178] GAM1736 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1736 target RNA, herein designated GAM TARGET RNA. GAM1736 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24179] GAM1736 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1736 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1736 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1736 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1736 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24180] The complementary binding of GAM1736 RNA, herein designated GAM RNA, to target binding sites on GAM1736 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1736 target RNA, herein designated GAM TARGET RNA, into GAM1736 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24181] It is appreciated that GAM1736 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1736 target genes. The mRNA of each one of this plurality of GAM1736 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1736 RNA, herein designated GAM RNA, and which when bound by GAM1736 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1736 target proteins.

[24182] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1736 gene, herein designated GAM GENE, on one or more GAM1736 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24183] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1736 correlate with, and may be deduced from, the identity of the target

genes which GAM1736 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24184] Nucleotide sequences of the GAM1736 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1736 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1736 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1736 are further described hereinbelow with reference to Table 1.

[24185] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1736 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24186] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1737 (GAM1737) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24187] GAM1737 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1737 was detected is described hereinabove with reference to Figs. 2-8.

[24188] GAM1737 gene, herein designated GAM GENE, and GAM1737 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[24189] GAM1737 gene, herein designated GAM GENE, encodes a GAM1737 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1737 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1737 precursor RNA is designated SEQ ID:1714, and is provided hereinbelow with reference to the sequence listing part.

[24190] GAM1737 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1737 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24191] An enzyme complex designated DICER COMPLEX, dices the GAM1737 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1737 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1737 RNA is designated SEQ ID:4319, and is provided

hereinbelow with reference to the sequence listing part.

[24192] GAM1737 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1737 target RNA, herein designated GAM TARGET RNA. GAM1737 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24193] GAM1737 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1737 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1737 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1737 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1737 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24194] The complementary binding of GAM1737 RNA, herein designated GAM RNA, to target binding sites on GAM1737 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1737 target RNA, herein designated GAM TARGET RNA, into GAM1737 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24195] It is appreciated that GAM1737 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1737 target genes. The mRNA of each one of this plurality of GAM1737 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1737 RNA, herein designated GAM RNA, and which when bound by GAM1737 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1737 target proteins.

[24196] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1737 gene, herein designated GAM GENE, on one or more GAM1737 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24197] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1737 correlate with, and may be deduced from, the identity of the target genes which GAM1737 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24198] Nucleotide sequences of the GAM1737 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1737 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1737 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1737 are further described hereinbelow with reference to Table 1.

[24199] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1737 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24200] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1738 (GAM1738) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24201] GAM1738 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1738 was detected is described hereinabove with reference to Figs. 2-8.

[24202] GAM1738 gene, herein designated GAM GENE, and GAM1738 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24203] GAM1738 gene, herein designated GAM GENE, encodes a GAM1738 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1738 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1738 precursor RNA is designated SEQ ID:1715, and is provided hereinbelow with reference to the sequence listing part.

[24204] GAM1738 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1738 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24205] An enzyme complex designated DICER COMPLEX, dices the GAM1738 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1738 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1738 RNA is designated SEQ ID:4320, and is provided hereinbelow with reference to the sequence listing part.

[24206] GAM1738 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1738 target RNA, herein designated GAM TARGET RNA. GAM1738 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24207] GAM1738 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1738 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1738 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1738 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1738 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24208] The complementary binding of GAM1738 RNA, herein designated GAM RNA, to target binding sites on GAM1738 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1738 target RNA, herein designated GAM TARGET RNA, into GAM1738 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24209] It is appreciated that GAM1738 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1738 target genes. The mRNA of each one of this plurality of GAM1738 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1738 RNA, herein designated GAM RNA, and which when bound by GAM1738 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1738 target proteins.

[24210] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1738 gene, herein designated GAM GENE, on one or more GAM1738 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24211] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1738 correlate with, and may be deduced from, the identity of the target genes which GAM1738 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24212] Nucleotide sequences of the GAM1738 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1738 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1738 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1738 are further described hereinbelow with reference to Table 1.

[24213] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1738 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24214] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1739 (GAM1739) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24215] GAM1739 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1739 was detected is described hereinabove with reference to Figs. 2-8.

[24216] GAM1739 gene, herein designated GAM GENE, and GAM1739 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24217] GAM1739 gene, herein designated GAM GENE, encodes a GAM1739 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1739 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1739 precursor RNA is designated SEQ ID:1716, and is provided hereinbelow with reference to the sequence listing part.

[24218] GAM1739 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1739 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24219] An enzyme complex designated DICER COMPLEX, dices the GAM1739 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1739 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1739 RNA is designated SEQ ID:4321, and is provided hereinbelow with reference to the sequence listing part.

[24220] GAM1739 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1739 target RNA, herein designated GAM TARGET RNA. GAM1739 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24221] GAM1739 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1739 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1739 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1739 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1739 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24222] The complementary binding of GAM1739 RNA, herein designated GAM RNA, to target binding sites on GAM1739 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1739 target RNA, herein designated GAM TARGET RNA, into GAM1739 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24223] It is appreciated that GAM1739 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1739 target genes. The mRNA of each one of this plurality of GAM1739 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1739 RNA, herein designated GAM RNA, and which when bound by GAM1739 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1739 target proteins.

[24224] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1739 gene, herein designated GAM GENE, on one or more GAM1739 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24225] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1739 correlate with, and may be deduced from, the identity of the target genes which GAM1739 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24226] Nucleotide sequences of the GAM1739 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1739 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1739 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1739 are further described hereinbelow with reference to Table 1.

[24227] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1739 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[24228] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1740 (GAM1740) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24229] GAM1740 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1740 was detected is described hereinabove with reference to Figs. 2-8.

[24230] GAM1740 gene, herein designated GAM GENE, and GAM1740 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24231] GAM1740 gene, herein designated GAM GENE, encodes a GAM1740 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1740 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1740 precursor RNA is designated SEQ ID:1717, and is provided hereinbelow with reference to the sequence listing part.

[24232] GAM1740 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1740 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24233] An enzyme complex designated DICER COMPLEX, dices the GAM1740 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1740 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1740 RNA is designated SEQ ID:4322, and is provided hereinbelow with reference to the sequence listing part.

[24234] GAM1740 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1740 target RNA, herein designated GAM TARGET RNA. GAM1740 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24235] GAM1740 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1740 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1740 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1740 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1740 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24236] The complementary binding of GAM1740 RNA, herein designated GAM RNA, to target binding sites on GAM1740 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1740 target RNA, herein designated GAM TARGET RNA, into GAM1740 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24237] It is appreciated that GAM1740 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1740 target genes. The mRNA of each one of this plurality of GAM1740 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1740 RNA, herein designated GAM RNA, and which when bound by GAM1740 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1740 target proteins.

[24238] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1740 gene, herein designated GAM GENE, on one or more GAM1740 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24239] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1740 correlate with, and may be deduced from, the identity of the target genes which GAM1740 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24240] Nucleotide sequences of the GAM1740 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1740 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1740 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1740 are further described hereinbelow with reference to Table 1.

[24241] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1740 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24242] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1741 (GAM1741) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24243] GAM1741 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1741 was detected is described hereinabove with reference to Figs. 2-8.

[24244] GAM1741 gene, herein designated GAM GENE, and GAM1741 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24245] GAM1741 gene, herein designated GAM GENE, encodes a GAM1741 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1741 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1741 precursor RNA is designated SEQ ID:1718, and is provided hereinbelow with reference to the sequence listing part.

[24246] GAM1741 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1741 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24247] An enzyme complex designated DICER COMPLEX, dices the GAM1741 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1741 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1741 RNA is designated SEQ ID:4323, and is provided hereinbelow with reference to the sequence listing part.

[24248] GAM1741 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1741 target RNA, herein designated GAM TARGET RNA. GAM1741 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24249] GAM1741 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1741 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1741 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1741 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1741 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24250] The complementary binding of GAM1741 RNA, herein designated GAM RNA, to target binding sites on GAM1741 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1741 target RNA, herein designated GAM TARGET RNA, into GAM1741 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24251] It is appreciated that GAM1741 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1741 target genes. The

mRNA of each one of this plurality of GAM1741 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1741 RNA, herein designated GAM RNA, and which when bound by GAM1741 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1741 target proteins.

[24252] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1741 gene, herein designated GAM GENE, on one or more GAM1741 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24253] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1741 correlate with, and may be deduced from, the identity of the target genes which GAM1741 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24254] Nucleotide sequences of the GAM1741 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1741 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1741 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1741 are further described hereinbelow with reference to Table 1.

[24255] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1741 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24256] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1742 (GAM1742) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24257] GAM1742 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1742 was detected is described hereinabove with reference to Figs. 2-8.

[24258] GAM1742 gene, herein designated GAM GENE, and GAM1742 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24259] GAM1742 gene, herein designated GAM GENE, encodes a GAM1742 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1742 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1742 precursor RNA is designated SEQ ID:1719, and is provided hereinbelow with reference to the sequence listing part.

[24260] GAM1742 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1742 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24261] An enzyme complex designated DICER COMPLEX, dices the GAM1742 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1742 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1742 RNA is designated SEQ ID:4324, and is provided hereinbelow with reference to the sequence listing part.

[24262] GAM1742 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1742 target RNA, herein designated GAM TARGET RNA. GAM1742 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24263] GAM1742 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1742 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1742 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1742 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1742 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24264] The complementary binding of GAM1742 RNA, herein designated GAM RNA, to target binding sites on GAM1742 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1742 target RNA, herein designated GAM TARGET RNA, into GAM1742 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24265] It is appreciated that GAM1742 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1742 target genes. The mRNA of each one of this plurality of GAM1742 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1742 RNA, herein designated GAM RNA, and which when bound by GAM1742 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1742 target proteins.

[24266] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1742 gene, herein designated GAM GENE, on one or more GAM1742 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24267] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1742 correlate with, and may be deduced from, the identity of the target

genes which GAM1742 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24268] Nucleotide sequences of the GAM1742 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1742 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1742 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1742 are further described hereinbelow with reference to Table 1.

[24269] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1742 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24270] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1743 (GAM1743) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24271] GAM1743 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1743 was detected is described hereinabove with reference to Figs. 2-8.

[24272] GAM1743 gene, herein designated GAM GENE, and GAM1743 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[24273] GAM1743 gene, herein designated GAM GENE, encodes a GAM1743 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1743 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1743 precursor RNA is designated SEQ ID:1720, and is provided hereinbelow with reference to the sequence listing part.

[24274] GAM1743 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1743 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24275] An enzyme complex designated DICER COMPLEX, dices the GAM1743 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1743 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1743 RNA is designated SEQ ID:4325, and is provided

hereinbelow with reference to the sequence listing part.

[24276] GAM1743 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1743 target RNA, herein designated GAM TARGET RNA. GAM1743 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24277] GAM1743 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1743 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1743 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1743 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1743 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24278] The complementary binding of GAM1743 RNA, herein designated GAM RNA, to target binding sites on GAM1743 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1743 target RNA, herein designated GAM TARGET RNA, into GAM1743 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24279] It is appreciated that GAM1743 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1743 target genes. The mRNA of each one of this plurality of GAM1743 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1743 RNA, herein designated GAM RNA, and which when bound by GAM1743 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1743 target proteins.

[24280] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1743 gene, herein designated GAM GENE, on one or more GAM1743 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24281] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1743 correlate with, and may be deduced from, the identity of the target genes which GAM1743 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24282] Nucleotide sequences of the GAM1743 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1743 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1743 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1743 are further described hereinbelow with reference to Table 1.

[24283] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1743 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24284] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1744 (GAM1744) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24285] GAM1744 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1744 was detected is described hereinabove with reference to Figs. 2-8.

[24286] GAM1744 gene, herein designated GAM GENE, and GAM1744 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24287] GAM1744 gene, herein designated GAM GENE, encodes a GAM1744 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1744 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1744 precursor RNA is designated SEQ ID:1721, and is provided hereinbelow with reference to the sequence listing part.

[24288] GAM1744 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24289] An enzyme complex designated DICER COMPLEX, dices the GAM1744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1744 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1744 RNA is designated SEQ ID:4326, and is provided hereinbelow with reference to the sequence listing part.

[24290] GAM1744 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1744 target RNA, herein designated GAM TARGET RNA. GAM1744 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24291] GAM1744 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1744 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1744 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1744 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1744 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24292] The complementary binding of GAM1744 RNA, herein designated GAM RNA, to target binding sites on GAM1744 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1744 target RNA, herein designated GAM TARGET RNA, into GAM1744 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24293] It is appreciated that GAM1744 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1744 target genes. The mRNA of each one of this plurality of GAM1744 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1744 RNA, herein designated GAM RNA, and which when bound by GAM1744 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1744 target proteins.

[24294] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1744 gene, herein designated GAM GENE, on one or more GAM1744 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24295] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1744 correlate with, and may be deduced from, the identity of the target genes which GAM1744 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24296] Nucleotide sequences of the GAM1744 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1744 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1744 are further described hereinbelow with reference to Table 1.

[24297] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1744 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24298] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1745 (GAM1745) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24299] GAM1745 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1745 was detected is described hereinabove with reference to Figs. 2-8.

[24300] GAM1745 gene, herein designated GAM GENE, and GAM1745 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24301] GAM1745 gene, herein designated GAM GENE, encodes a GAM1745 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1745 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1745 precursor RNA is designated SEQ ID:1722, and is provided hereinbelow with reference to the sequence listing part.

[24302] GAM1745 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1745 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24303] An enzyme complex designated DICER COMPLEX, dices the GAM1745 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1745 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1745 RNA is designated SEQ ID:4327, and is provided hereinbelow with reference to the sequence listing part.

[24304] GAM1745 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1745 target RNA, herein designated GAM TARGET RNA. GAM1745 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24305] GAM1745 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1745 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1745 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1745 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1745 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24306] The complementary binding of GAM1745 RNA, herein designated GAM RNA, to target binding sites on GAM1745 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1745 target RNA, herein designated GAM TARGET RNA, into GAM1745 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24307] It is appreciated that GAM1745 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1745 target genes. The mRNA of each one of this plurality of GAM1745 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1745 RNA, herein designated GAM RNA, and which when bound by GAM1745 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1745 target proteins.

[24308] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1745 gene, herein designated GAM GENE, on one or more GAM1745 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24309] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1745 correlate with, and may be deduced from, the identity of the target genes which GAM1745 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24310] Nucleotide sequences of the GAM1745 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1745 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1745 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1745 are further described hereinbelow with reference to Table 1.

[24311] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1745 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[24312] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1746 (GAM1746) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24313] GAM1746 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1746 was detected is described hereinabove with reference to Figs. 2-8.

[24314] GAM1746 gene, herein designated GAM GENE, and GAM1746 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24315] GAM1746 gene, herein designated GAM GENE, encodes a GAM1746 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1746 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1746 precursor RNA is designated SEQ ID:1723, and is provided hereinbelow with reference to the sequence listing part.

[24316] GAM1746 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1746 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24317] An enzyme complex designated DICER COMPLEX, dices the GAM1746 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1746 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1746 RNA is designated SEQ ID:4328, and is provided hereinbelow with reference to the sequence listing part.

[24318] GAM1746 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1746 target RNA, herein designated GAM TARGET RNA. GAM1746 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24319] GAM1746 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1746 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1746 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1746 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1746 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24320] The complementary binding of GAM1746 RNA, herein designated GAM RNA, to target binding sites on GAM1746 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1746 target RNA, herein designated GAM TARGET RNA, into GAM1746 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24321] It is appreciated that GAM1746 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1746 target genes. The mRNA of each one of this plurality of GAM1746 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1746 RNA, herein designated GAM RNA, and which when bound by GAM1746 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1746 target proteins.

[24322] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1746 gene, herein designated GAM GENE, on one or more GAM1746 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24323] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1746 correlate with, and may be deduced from, the identity of the target genes which GAM1746 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24324] Nucleotide sequences of the GAM1746 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1746 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1746 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1746 are further described hereinbelow with reference to Table 1.

[24325] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1746 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24326] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1747 (GAM1747) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24327] GAM1747 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1747 was detected is described hereinabove with reference to Figs. 2-8.

[24328] GAM1747 gene, herein designated GAM GENE, and GAM1747 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24329] GAM1747 gene, herein designated GAM GENE, encodes a GAM1747 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1747 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1747 precursor RNA is designated SEQ ID:1724, and is provided hereinbelow with reference to the sequence listing part.

[24330] GAM1747 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1747 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24331] An enzyme complex designated DICER COMPLEX, dices the GAM1747 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1747 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1747 RNA is designated SEQ ID:4329, and is provided hereinbelow with reference to the sequence listing part.

[24332] GAM1747 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1747 target RNA, herein designated GAM TARGET RNA. GAM1747 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24333] GAM1747 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1747 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1747 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1747 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1747 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24334] The complementary binding of GAM1747 RNA, herein designated GAM RNA, to target binding sites on GAM1747 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1747 target RNA, herein designated GAM TARGET RNA, into GAM1747 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24335] It is appreciated that GAM1747 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1747 target genes. The

mRNA of each one of this plurality of GAM1747 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1747 RNA, herein designated GAM RNA, and which when bound by GAM1747 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1747 target proteins.

[24336] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1747 gene, herein designated GAM GENE, on one or more GAM1747 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24337] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1747 correlate with, and may be deduced from, the identity of the target genes which GAM1747 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24338] Nucleotide sequences of the GAM1747 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1747 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1747 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1747 are further described hereinbelow with reference to Table 1.

[24339] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1747 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24340] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1748 (GAM1748) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24341] GAM1748 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1748 was detected is described hereinabove with reference to Figs. 2-8.

[24342] GAM1748 gene, herein designated GAM GENE, and GAM1748 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24343] GAM1748 gene, herein designated GAM GENE, encodes a GAM1748 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1748 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1748 precursor RNA is designated SEQ ID:1725, and is provided hereinbelow with reference to the sequence listing part.

[24344] GAM1748 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1748 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24345] An enzyme complex designated DICER COMPLEX, dices the GAM1748 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1748 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1748 RNA is designated SEQ ID:4330, and is provided hereinbelow with reference to the sequence listing part.

[24346] GAM1748 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1748 target RNA, herein designated GAM TARGET RNA. GAM1748 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24347] GAM1748 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1748 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1748 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1748 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1748 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24348] The complementary binding of GAM1748 RNA, herein designated GAM RNA, to target binding sites on GAM1748 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1748 target RNA, herein designated GAM TARGET RNA, into GAM1748 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24349] It is appreciated that GAM1748 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1748 target genes. The mRNA of each one of this plurality of GAM1748 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1748 RNA, herein designated GAM RNA, and which when bound by GAM1748 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1748 target proteins.

[24350] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1748 gene, herein designated GAM GENE, on one or more GAM1748 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24351] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1748 correlate with, and may be deduced from, the identity of the target

genes which GAM1748 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24352] Nucleotide sequences of the GAM1748 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1748 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1748 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1748 are further described hereinbelow with reference to Table 1.

[24353] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1748 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24354] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1749 (GAM1749) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24355] GAM1749 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1749 was detected is described hereinabove with reference to Figs. 2-8.

[24356] GAM1749 gene, herein designated GAM GENE, and GAM1749 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[24357] GAM1749 gene, herein designated GAM GENE, encodes a GAM1749 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1749 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1749 precursor RNA is designated SEQ ID:1726, and is provided hereinbelow with reference to the sequence listing part.

[24358] GAM1749 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1749 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24359] An enzyme complex designated DICER COMPLEX, dices the GAM1749 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1749 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1749 RNA is designated SEQ ID:4332, and is provided

hereinbelow with reference to the sequence listing part.

[24360] GAM1749 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1749 target RNA, herein designated GAM TARGET RNA. GAM1749 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24361] GAM1749 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1749 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1749 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1749 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1749 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24362] The complementary binding of GAM1749 RNA, herein designated GAM RNA, to target binding sites on GAM1749 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1749 target RNA, herein designated GAM TARGET RNA, into GAM1749 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24363] It is appreciated that GAM1749 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1749 target genes. The mRNA of each one of this plurality of GAM1749 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1749 RNA, herein designated GAM RNA, and which when bound by GAM1749 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1749 target proteins.

[24364] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1749 gene, herein designated GAM GENE, on one or more GAM1749 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24365] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1749 correlate with, and may be deduced from, the identity of the target genes which GAM1749 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24366] Nucleotide sequences of the GAM1749 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1749 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1749 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1749 are further described hereinbelow with reference to Table 1.

[24367] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1749 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24368] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1750 (GAM1750) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24369] GAM1750 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1750 was detected is described hereinabove with reference to Figs. 2-8.

[24370] GAM1750 gene, herein designated GAM GENE, and GAM1750 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24371] GAM1750 gene, herein designated GAM GENE, encodes a GAM1750 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1750 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1750 precursor RNA is designated SEQ ID:1727, and is provided hereinbelow with reference to the sequence listing part.

[24372] GAM1750 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1750 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24373] An enzyme complex designated DICER COMPLEX, dices the GAM1750 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1750 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1750 RNA is designated SEQ ID:4331, and is provided hereinbelow with reference to the sequence listing part.

[24374] GAM1750 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1750 target RNA, herein designated GAM TARGET RNA. GAM1750 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24375] GAM1750 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1750 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1750 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1750 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1750 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24376] The complementary binding of GAM1750 RNA, herein designated GAM RNA, to target binding sites on GAM1750 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1750 target RNA, herein designated GAM TARGET RNA, into GAM1750 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24377] It is appreciated that GAM1750 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1750 target genes. The mRNA of each one of this plurality of GAM1750 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1750 RNA, herein designated GAM RNA, and which when bound by GAM1750 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1750 target proteins.

[24378] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1750 gene, herein designated GAM GENE, on one or more GAM1750 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24379] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1750 correlate with, and may be deduced from, the identity of the target genes which GAM1750 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24380] Nucleotide sequences of the GAM1750 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1750 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1750 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1750 are further described hereinbelow with reference to Table 1.

[24381] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1750 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24382] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1751 (GAM1751) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24383] GAM1751 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1751 was detected is described hereinabove with reference to Figs. 2-8.

[24384] GAM1751 gene, herein designated GAM GENE, and GAM1751 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24385] GAM1751 gene, herein designated GAM GENE, encodes a GAM1751 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1751 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1751 precursor RNA is designated SEQ ID:1728, and is provided hereinbelow with reference to the sequence listing part.

[24386] GAM1751 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1751 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24387] An enzyme complex designated DICER COMPLEX, dices the GAM1751 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1751 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1751 RNA is designated SEQ ID:4333, and is provided hereinbelow with reference to the sequence listing part.

[24388] GAM1751 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1751 target RNA, herein designated GAM TARGET RNA. GAM1751 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24389] GAM1751 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1751 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1751 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1751 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1751 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24390] The complementary binding of GAM1751 RNA, herein designated GAM RNA, to target binding sites on GAM1751 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1751 target RNA, herein designated GAM TARGET RNA, into GAM1751 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24391] It is appreciated that GAM1751 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1751 target genes. The mRNA of each one of this plurality of GAM1751 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1751 RNA, herein designated GAM RNA, and which when bound by GAM1751 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1751 target proteins.

[24392] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1751 gene, herein designated GAM GENE, on one or more GAM1751 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24393] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1751 correlate with, and may be deduced from, the identity of the target genes which GAM1751 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24394] Nucleotide sequences of the GAM1751 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1751 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1751 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1751 are further described hereinbelow with reference to Table 1.

[24395] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1751 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[24396] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1752 (GAM1752) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24397] GAM1752 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1752 was detected is described hereinabove with reference to Figs. 2-8.

[24398] GAM1752 gene, herein designated GAM GENE, and GAM1752 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24399] GAM1752 gene, herein designated GAM GENE, encodes a GAM1752 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1752 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1752 precursor RNA is designated SEQ ID:1729, and is provided hereinbelow with reference to the sequence listing part.

[24400] GAM1752 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1752 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24401] An enzyme complex designated DICER COMPLEX, dices the GAM1752 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1752 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1752 RNA is designated SEQ ID:4334, and is provided hereinbelow with reference to the sequence listing part.

[24402] GAM1752 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1752 target RNA, herein designated GAM TARGET RNA. GAM1752 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24403] GAM1752 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1752 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1752 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1752 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1752 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24404] The complementary binding of GAM1752 RNA, herein designated GAM RNA, to target binding sites on GAM1752 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1752 target RNA, herein designated GAM TARGET RNA, into GAM1752 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24405] It is appreciated that GAM1752 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1752 target genes. The mRNA of each one of this plurality of GAM1752 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1752 RNA, herein designated GAM RNA, and which when bound by GAM1752 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1752 target proteins.

[24406] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1752 gene, herein designated GAM GENE, on one or more GAM1752 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24407] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1752 correlate with, and may be deduced from, the identity of the target genes which GAM1752 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24408] Nucleotide sequences of the GAM1752 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1752 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1752 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1752 are further described hereinbelow with reference to Table 1.

[24409] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1752 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24410] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1753 (GAM1753) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24411] GAM1753 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1753 was detected is described hereinabove with reference to Figs. 2-8.

[24412] GAM1753 gene, herein designated GAM GENE, and GAM1753 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24413] GAM1753 gene, herein designated GAM GENE, encodes a GAM1753 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1753 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1753 precursor RNA is designated SEQ ID:1730, and is provided hereinbelow with reference to the sequence listing part.

[24414] GAM1753 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1753 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24415] An enzyme complex designated DICER COMPLEX, dices the GAM1753 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1753 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1753 RNA is designated SEQ ID:4335, and is provided hereinbelow with reference to the sequence listing part.

[24416] GAM1753 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1753 target RNA, herein designated GAM TARGET RNA. GAM1753 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24417] GAM1753 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1753 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1753 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1753 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1753 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24418] The complementary binding of GAM1753 RNA, herein designated GAM RNA, to target binding sites on GAM1753 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1753 target RNA, herein designated GAM TARGET RNA, into GAM1753 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24419] It is appreciated that GAM1753 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1753 target genes. The

mRNA of each one of this plurality of GAM1753 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1753 RNA, herein designated GAM RNA, and which when bound by GAM1753 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1753 target proteins.

[24420] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1753 gene, herein designated GAM GENE, on one or more GAM1753 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24421] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1753 correlate with, and may be deduced from, the identity of the target genes which GAM1753 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24422] Nucleotide sequences of the GAM1753 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1753 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1753 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1753 are further described hereinbelow with reference to Table 1.

[24423] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1753 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24424] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1754 (GAM1754) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24425] GAM1754 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1754 was detected is described hereinabove with reference to Figs. 2-8.

[24426] GAM1754 gene, herein designated GAM GENE, and GAM1754 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24427] GAM1754 gene, herein designated GAM GENE, encodes a GAM1754 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1754 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1754 precursor RNA is designated SEQ ID:1731, and is provided hereinbelow with reference to the sequence listing part.

[24428] GAM1754 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1754 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24429] An enzyme complex designated DICER COMPLEX, dices the GAM1754 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1754 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1754 RNA is designated SEQ ID:4336, and is provided hereinbelow with reference to the sequence listing part.

[24430] GAM1754 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1754 target RNA, herein designated GAM TARGET RNA. GAM1754 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24431] GAM1754 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1754 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1754 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1754 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1754 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24432] The complementary binding of GAM1754 RNA, herein designated GAM RNA, to target binding sites on GAM1754 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1754 target RNA, herein designated GAM TARGET RNA, into GAM1754 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24433] It is appreciated that GAM1754 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1754 target genes. The mRNA of each one of this plurality of GAM1754 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1754 RNA, herein designated GAM RNA, and which when bound by GAM1754 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1754 target proteins.

[24434] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1754 gene, herein designated GAM GENE, on one or more GAM1754 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24435] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1754 correlate with, and may be deduced from, the identity of the target

genes which GAM1754 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24436] Nucleotide sequences of the GAM1754 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1754 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1754 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1754 are further described hereinbelow with reference to Table 1.

[24437] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1754 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24438] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1755 (GAM1755) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24439] GAM1755 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1755 was detected is described hereinabove with reference to Figs. 2-8.

[24440] GAM1755 gene, herein designated GAM GENE, and GAM1755 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[24441] GAM1755 gene, herein designated GAM GENE, encodes a GAM1755 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1755 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1755 precursor RNA is designated SEQ ID:1732, and is provided hereinbelow with reference to the sequence listing part.

[24442] GAM1755 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1755 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24443] An enzyme complex designated DICER COMPLEX, dices the GAM1755 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1755 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1755 RNA is designated SEQ ID:4337, and is provided

hereinbelow with reference to the sequence listing part.

[24444] GAM1755 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1755 target RNA, herein designated GAM TARGET RNA. GAM1755 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24445] GAM1755 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1755 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1755 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1755 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1755 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24446] The complementary binding of GAM1755 RNA, herein designated GAM RNA, to target binding sites on GAM1755 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1755 target RNA, herein designated GAM TARGET RNA, into GAM1755 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24447] It is appreciated that GAM1755 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1755 target genes. The mRNA of each one of this plurality of GAM1755 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1755 RNA, herein designated GAM RNA, and which when bound by GAM1755 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1755 target proteins.

[24448] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1755 gene, herein designated GAM GENE, on one or more GAM1755 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24449] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1755 correlate with, and may be deduced from, the identity of the target genes which GAM1755 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24450] Nucleotide sequences of the GAM1755 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1755 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1755 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1755 are further described hereinbelow with reference to Table 1.

[24451] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1755 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24452] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1756 (GAM1756) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24453] GAM1756 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1756 was detected is described hereinabove with reference to Figs. 2-8.

[24454] GAM1756 gene, herein designated GAM GENE, and GAM1756 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24455] GAM1756 gene, herein designated GAM GENE, encodes a GAM1756 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1756 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1756 precursor RNA is designated SEQ ID:1733, and is provided hereinbelow with reference to the sequence listing part.

[24456] GAM1756 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1756 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24457] An enzyme complex designated DICER COMPLEX, dices the GAM1756 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1756 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1756 RNA is designated SEQ ID:4338, and is provided hereinbelow with reference to the sequence listing part.

[24458] GAM1756 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1756 target RNA, herein designated GAM TARGET RNA. GAM1756 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24459] GAM1756 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1756 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1756 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1756 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1756 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24460] The complementary binding of GAM1756 RNA, herein designated GAM RNA, to target binding sites on GAM1756 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1756 target RNA, herein designated GAM TARGET RNA, into GAM1756 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24461] It is appreciated that GAM1756 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1756 target genes. The mRNA of each one of this plurality of GAM1756 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1756 RNA, herein designated GAM RNA, and which when bound by GAM1756 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1756 target proteins.

[24462] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1756 gene, herein designated GAM GENE, on one or more GAM1756 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24463] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1756 correlate with, and may be deduced from, the identity of the target genes which GAM1756 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24464] Nucleotide sequences of the GAM1756 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1756 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1756 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1756 are further described hereinbelow with reference to Table 1.

[24465] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1756 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24466] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1757 (GAM1757) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24467] GAM1757 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1757 was detected is described hereinabove with reference to Figs. 2-8.

[24468] GAM1757 gene, herein designated GAM GENE, and GAM1757 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24469] GAM1757 gene, herein designated GAM GENE, encodes a GAM1757 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1757 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1757 precursor RNA is designated SEQ ID:1734, and is provided hereinbelow with reference to the sequence listing part.

[24470] GAM1757 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1757 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24471] An enzyme complex designated DICER COMPLEX, dices the GAM1757 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1757 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1757 RNA is designated SEQ ID:4339, and is provided hereinbelow with reference to the sequence listing part.

[24472] GAM1757 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1757 target RNA, herein designated GAM TARGET RNA. GAM1757 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24473] GAM1757 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1757 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1757 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1757 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1757 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24474] The complementary binding of GAM1757 RNA, herein designated GAM RNA, to target binding sites on GAM1757 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1757 target RNA, herein designated GAM TARGET RNA, into GAM1757 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24475] It is appreciated that GAM1757 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1757 target genes. The mRNA of each one of this plurality of GAM1757 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1757 RNA, herein designated GAM RNA, and which when bound by GAM1757 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1757 target proteins.

[24476] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1757 gene, herein designated GAM GENE, on one or more GAM1757 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24477] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1757 correlate with, and may be deduced from, the identity of the target genes which GAM1757 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24478] Nucleotide sequences of the GAM1757 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1757 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1757 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1757 are further described hereinbelow with reference to Table 1.

[24479] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1757 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[24480] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1758 (GAM1758) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24481] GAM1758 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1758 was detected is described hereinabove with reference to Figs. 2-8.

[24482] GAM1758 gene, herein designated GAM GENE, and GAM1758 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24483] GAM1758 gene, herein designated GAM GENE, encodes a GAM1758 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1758 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1758 precursor RNA is designated SEQ ID:1735, and is provided hereinbelow with reference to the sequence listing part.

[24484] GAM1758 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1758 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24485] An enzyme complex designated DICER COMPLEX, dices the GAM1758 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1758 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1758 RNA is designated SEQ ID:4340, and is provided hereinbelow with reference to the sequence listing part.

[24486] GAM1758 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1758 target RNA, herein designated GAM TARGET RNA. GAM1758 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24487] GAM1758 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1758 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1758 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1758 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1758 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[24488] The complementary binding of GAM1758 RNA, herein designated GAM RNA, to target binding sites on GAM1758 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1758 target RNA, herein designated GAM TARGET RNA, into GAM1758 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24489] It is appreciated that GAM1758 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1758 target genes. The mRNA of each one of this plurality of GAM1758 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1758 RNA, herein designated GAM RNA, and which when bound by GAM1758 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1758 target proteins.

[24490] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1758 gene, herein designated GAM GENE, on one or more GAM1758 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24491] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1758 correlate with, and may be deduced from, the identity of the target genes which GAM1758 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24492] Nucleotide sequences of the GAM1758 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1758 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1758 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1758 are further described hereinbelow with reference to Table 1.

[24493] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1758 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24494] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1759 (GAM1759) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24495] GAM1759 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1759 was detected is described hereinabove with reference to Figs. 2-8.

[24496] GAM1759 gene, herein designated GAM GENE, and GAM1759 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24497] GAM1759 gene, herein designated GAM GENE, encodes a GAM1759 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1759 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1759 precursor RNA is designated SEQ ID:1736, and is provided hereinbelow with reference to the sequence listing part.

[24498] GAM1759 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1759 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24499] An enzyme complex designated DICER COMPLEX, dices the GAM1759 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1759 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1759 RNA is designated SEQ ID:4341, and is provided hereinbelow with reference to the sequence listing part.

[24500] GAM1759 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1759 target RNA, herein designated GAM TARGET RNA. GAM1759 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24501] GAM1759 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1759 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1759 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1759 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1759 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24502] The complementary binding of GAM1759 RNA, herein designated GAM RNA, to target binding sites on GAM1759 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1759 target RNA, herein designated GAM TARGET RNA, into GAM1759 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24503] It is appreciated that GAM1759 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1759 target genes. The mRNA of each one of this plurality of GAM1759 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1759 RNA, herein designated GAM RNA, and which when bound by GAM1759 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1759 target proteins.

[24504] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1759 gene, herein designated GAM GENE, on one or more GAM1759 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24505] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1759 correlate with, and may be deduced from, the identity of the target genes which GAM1759 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24506] Nucleotide sequences of the GAM1759 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1759 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1759 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1759 are further described hereinbelow with reference to Table 1.

[24507] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1759 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24508] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 1760 (GAM1760) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24509] GAM1760 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1760 was detected is described hereinabove with reference to Figs. 2-8.

[24510] GAM1760 gene, herein designated GAM GENE, and GAM1760 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24511] GAM1760 gene, herein designated GAM GENE, encodes a GAM1760 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1760 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1760 precursor RNA is designated SEQ ID:1737, and is provided hereinbelow with reference to the sequence listing part.

[24512] GAM1760 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1760 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24513] An enzyme complex designated DICER COMPLEX, dices the GAM1760 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1760 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1760 RNA is designated SEQ ID:4342, and is provided hereinbelow with reference to the sequence listing part.

[24514] GAM1760 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1760 target RNA, herein designated GAM TARGET RNA. GAM1760 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24515] GAM1760 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1760 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1760 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1760 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1760 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24516] The complementary binding of GAM1760 RNA, herein designated GAM RNA, to target binding sites on GAM1760 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1760 target RNA, herein designated GAM TARGET RNA, into GAM1760 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24517] It is appreciated that GAM1760 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1760 target genes. The mRNA of each one of this plurality of GAM1760 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1760 RNA, herein designated GAM RNA, and which when bound by GAM1760 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1760 target proteins.

[24518] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1760 gene, herein designated GAM GENE, on one or more GAM1760 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24519] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1760 correlate with, and may be deduced from, the identity of the target genes which GAM1760 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24520] Nucleotide sequences of the GAM1760 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1760 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1760 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1760 are further described hereinbelow with reference to Table 1.

[24521] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1760 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[24522] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1761 (GAM1761) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24523] GAM1761 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1761 was detected is described hereinabove with reference to Figs. 2-8.

[24524] GAM1761 gene, herein designated GAM GENE, and GAM1761 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24525] GAM1761 gene, herein designated GAM GENE, encodes a GAM1761 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1761 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1761 precursor RNA is designated SEQ ID:1738, and is provided hereinbelow with reference to the sequence listing part.

[24526] GAM1761 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1761 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24527] An enzyme complex designated DICER COMPLEX, dices the GAM1761 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1761 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1761 RNA is designated SEQ ID:4343, and is provided hereinbelow with reference to the sequence listing part.

[24528] GAM1761 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1761 target RNA, herein designated GAM TARGET RNA. GAM1761 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24529] GAM1761 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1761 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1761 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1761 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1761 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24530] The complementary binding of GAM1761 RNA, herein designated GAM RNA, to target binding sites on GAM1761 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1761 target RNA, herein designated GAM TARGET RNA, into GAM1761 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24531] It is appreciated that GAM1761 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1761 target genes. The mRNA of each one of this plurality of GAM1761 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1761 RNA, herein designated GAM RNA, and which when bound by GAM1761 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1761 target proteins.

[24532] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1761 gene, herein designated GAM GENE, on one or more GAM1761 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24533] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1761 correlate with, and may be deduced from, the identity of the target genes which GAM1761 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24534] Nucleotide sequences of the GAM1761 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1761 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1761 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1761 are further described hereinbelow with reference to Table 1.

[24535] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1761 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24536] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1762 (GAM1762) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24537] GAM1762 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1762 was detected is described hereinabove with reference to Figs. 2-8.

[24538] GAM1762 gene, herein designated GAM GENE, and GAM1762 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24539] GAM1762 gene, herein designated GAM GENE, encodes a GAM1762 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1762 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1762 precursor RNA is designated SEQ ID:1739, and is provided hereinbelow with reference to the sequence listing part.

[24540] GAM1762 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1762 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24541] An enzyme complex designated DICER COMPLEX, dices the GAM1762 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1762 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1762 RNA is designated SEQ ID:4344, and is provided hereinbelow with reference to the sequence listing part.

[24542] GAM1762 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1762 target RNA, herein designated GAM TARGET RNA. GAM1762 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24543] GAM1762 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1762 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1762 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1762 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1762 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24544] The complementary binding of GAM1762 RNA, herein designated GAM RNA, to target binding sites on GAM1762 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1762 target RNA, herein designated GAM TARGET RNA, into GAM1762 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24545] It is appreciated that GAM1762 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1762 target genes. The

mRNA of each one of this plurality of GAM1762 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1762 RNA, herein designated GAM RNA, and which when bound by GAM1762 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1762 target proteins.

[24546] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1762 gene, herein designated GAM GENE, on one or more GAM1762 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24547] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1762 correlate with, and may be deduced from, the identity of the target genes which GAM1762 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24548] Nucleotide sequences of the GAM1762 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1762 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1762 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1762 are further described hereinbelow with reference to Table 1.

[24549] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1762 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24550] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1763 (GAM1763) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24551] GAM1763 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1763 was detected is described hereinabove with reference to Figs. 2-8.

[24552] GAM1763 gene, herein designated GAM GENE, and GAM1763 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24553] GAM1763 gene, herein designated GAM GENE, encodes a GAM1763 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1763 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1763 precursor RNA is designated SEQ ID:1740, and is provided hereinbelow with reference to the sequence listing part.

[24554] GAM1763 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1763 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24555] An enzyme complex designated DICER COMPLEX, dices the GAM1763 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1763 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1763 RNA is designated SEQ ID:4345, and is provided hereinbelow with reference to the sequence listing part.

[24556] GAM1763 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1763 target RNA, herein designated GAM TARGET RNA. GAM1763 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24557] GAM1763 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1763 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1763 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1763 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1763 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24558] The complementary binding of GAM1763 RNA, herein designated GAM RNA, to target binding sites on GAM1763 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1763 target RNA, herein designated GAM TARGET RNA, into GAM1763 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24559] It is appreciated that GAM1763 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1763 target genes. The mRNA of each one of this plurality of GAM1763 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1763 RNA, herein designated GAM RNA, and which when bound by GAM1763 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1763 target proteins.

[24560] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1763 gene, herein designated GAM GENE, on one or more GAM1763 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24561] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1763 correlate with, and may be deduced from, the identity of the target

genes which GAM1763 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24562] Nucleotide sequences of the GAM1763 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1763 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1763 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1763 are further described hereinbelow with reference to Table 1.

[24563] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1763 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24564] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1764 (GAM1764) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24565] GAM1764 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1764 was detected is described hereinabove with reference to Figs. 2-8.

[24566] GAM1764 gene, herein designated GAM GENE, and GAM1764 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[24567] GAM1764 gene, herein designated GAM GENE, encodes a GAM1764 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1764 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1764 precursor RNA is designated SEQ ID:1741, and is provided hereinbelow with reference to the sequence listing part.

[24568] GAM1764 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1764 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24569] An enzyme complex designated DICER COMPLEX, dices the GAM1764 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1764 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1764 RNA is designated SEQ ID:4346, and is provided

hereinbelow with reference to the sequence listing part.

[24570] GAM1764 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1764 target RNA, herein designated GAM TARGET RNA. GAM1764 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24571] GAM1764 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1764 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1764 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1764 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1764 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24572] The complementary binding of GAM1764 RNA, herein designated GAM RNA, to target binding sites on GAM1764 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1764 target RNA, herein designated GAM TARGET RNA, into GAM1764 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24573] It is appreciated that GAM1764 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1764 target genes. The mRNA of each one of this plurality of GAM1764 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1764 RNA, herein designated GAM RNA, and which when bound by GAM1764 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1764 target proteins.

[24574] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1764 gene, herein designated GAM GENE, on one or more GAM1764 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24575] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1764 correlate with, and may be deduced from, the identity of the target genes which GAM1764 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24576] Nucleotide sequences of the GAM1764 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1764 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1764 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1764 are further described hereinbelow with reference to Table 1.

[24577] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1764 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24578] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1765 (GAM1765) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24579] GAM1765 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1765 was detected is described hereinabove with reference to Figs. 2-8.

[24580] GAM1765 gene, herein designated GAM GENE, and GAM1765 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24581] GAM1765 gene, herein designated GAM GENE, encodes a GAM1765 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1765 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1765 precursor RNA is designated SEQ ID:1742, and is provided hereinbelow with reference to the sequence listing part.

[24582] GAM1765 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1765 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24583] An enzyme complex designated DICER COMPLEX, dices the GAM1765 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1765 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1765 RNA is designated SEQ ID:4347, and is provided hereinbelow with reference to the sequence listing part.

[24584] GAM1765 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1765 target RNA, herein designated GAM TARGET RNA. GAM1765 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24585] GAM1765 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1765 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1765 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1765 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1765 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24586] The complementary binding of GAM1765 RNA, herein designated GAM RNA, to target binding sites on GAM1765 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1765 target RNA, herein designated GAM TARGET RNA, into GAM1765 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24587] It is appreciated that GAM1765 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1765 target genes. The mRNA of each one of this plurality of GAM1765 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1765 RNA, herein designated GAM RNA, and which when bound by GAM1765 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1765 target proteins.

[24588] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1765 gene, herein designated GAM GENE, on one or more GAM1765 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24589] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1765 correlate with, and may be deduced from, the identity of the target genes which GAM1765 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24590] Nucleotide sequences of the GAM1765 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1765 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1765 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1765 are further described hereinbelow with reference to Table 1.

[24591] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1765 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24592] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1766 (GAM1766) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24593] GAM1766 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1766 was detected is described hereinabove with reference to Figs. 2-8.

[24594] GAM1766 gene, herein designated GAM GENE, and GAM1766 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24595] GAM1766 gene, herein designated GAM GENE, encodes a GAM1766 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1766 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1766 precursor RNA is designated SEQ ID:1743, and is provided hereinbelow with reference to the sequence listing part.

[24596] GAM1766 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1766 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24597] An enzyme complex designated DICER COMPLEX, dices the GAM1766 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1766 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1766 RNA is designated SEQ ID:4348, and is provided hereinbelow with reference to the sequence listing part.

[24598] GAM1766 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1766 target RNA, herein designated GAM TARGET RNA. GAM1766 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24599] GAM1766 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1766 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1766 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1766 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1766 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24600] The complementary binding of GAM1766 RNA, herein designated GAM RNA, to target binding sites on GAM1766 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1766 target RNA, herein designated GAM TARGET RNA, into GAM1766 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24601] It is appreciated that GAM1766 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1766 target genes. The mRNA of each one of this plurality of GAM1766 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1766 RNA, herein designated GAM RNA, and which when bound by GAM1766 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1766 target proteins.

[24602] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1766 gene, herein designated GAM GENE, on one or more GAM1766 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24603] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1766 correlate with, and may be deduced from, the identity of the target genes which GAM1766 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24604] Nucleotide sequences of the GAM1766 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1766 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1766 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1766 are further described hereinbelow with reference to Table 1.

[24605] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1766 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[24606] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1767 (GAM1767) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24607] GAM1767 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1767 was detected is described hereinabove with reference to Figs. 2-8.

[24608] GAM1767 gene, herein designated GAM GENE, and GAM1767 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24609] GAM1767 gene, herein designated GAM GENE, encodes a GAM1767 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1767 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1767 precursor RNA is designated SEQ ID:1744, and is provided hereinbelow with reference to the sequence listing part.

[24610] GAM1767 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1767 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24611] An enzyme complex designated DICER COMPLEX, dices the GAM1767 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1767 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1767 RNA is designated SEQ ID:4349, and is provided hereinbelow with reference to the sequence listing part.

[24612] GAM1767 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1767 target RNA, herein designated GAM TARGET RNA. GAM1767 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24613] GAM1767 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1767 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1767 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1767 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1767 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24614] The complementary binding of GAM1767 RNA, herein designated GAM RNA, to target binding sites on GAM1767 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1767 target RNA, herein designated GAM TARGET RNA, into GAM1767 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24615] It is appreciated that GAM1767 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1767 target genes. The mRNA of each one of this plurality of GAM1767 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1767 RNA, herein designated GAM RNA, and which when bound by GAM1767 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1767 target proteins.

[24616] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1767 gene, herein designated GAM GENE, on one or more GAM1767 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24617] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1767 correlate with, and may be deduced from, the identity of the target genes which GAM1767 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24618] Nucleotide sequences of the GAM1767 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1767 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1767 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1767 are further described hereinbelow with reference to Table 1.

[24619] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1767 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24620] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1768 (GAM1768) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24621] GAM1768 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1768 was detected is described hereinabove with reference to Figs. 2-8.

[24622] GAM1768 gene, herein designated GAM GENE, and GAM1768 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24623] GAM1768 gene, herein designated GAM GENE, encodes a GAM1768 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1768 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1768 precursor RNA is designated SEQ ID:1745, and is provided hereinbelow with reference to the sequence listing part.

[24624] GAM1768 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1768 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24625] An enzyme complex designated DICER COMPLEX, dices the GAM1768 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1768 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1768 RNA is designated SEQ ID:4351, and is provided hereinbelow with reference to the sequence listing part.

[24626] GAM1768 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1768 target RNA, herein designated GAM TARGET RNA. GAM1768 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24627] GAM1768 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1768 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1768 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1768 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1768 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24628] The complementary binding of GAM1768 RNA, herein designated GAM RNA, to target binding sites on GAM1768 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1768 target RNA, herein designated GAM TARGET RNA, into GAM1768 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24629] It is appreciated that GAM1768 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1768 target genes. The

mRNA of each one of this plurality of GAM1768 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1768 RNA, herein designated GAM RNA, and which when bound by GAM1768 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1768 target proteins.

[24630] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1768 gene, herein designated GAM GENE, on one or more GAM1768 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24631] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1768 correlate with, and may be deduced from, the identity of the target genes which GAM1768 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24632] Nucleotide sequences of the GAM1768 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1768 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1768 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1768 are further described hereinbelow with reference to Table 1.

[24633] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1768 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24634] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1769 (GAM1769) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24635] GAM1769 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1769 was detected is described hereinabove with reference to Figs. 2-8.

[24636] GAM1769 gene, herein designated GAM GENE, and GAM1769 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24637] GAM1769 gene, herein designated GAM GENE, encodes a GAM1769 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1769 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1769 precursor RNA is designated SEQ ID:1746, and is provided hereinbelow with reference to the sequence listing part.

[24638] GAM1769 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1769 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24639] An enzyme complex designated DICER COMPLEX, dices the GAM1769 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1769 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1769 RNA is designated SEQ ID:4350, and is provided hereinbelow with reference to the sequence listing part.

[24640] GAM1769 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1769 target RNA, herein designated GAM TARGET RNA. GAM1769 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24641] GAM1769 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1769 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1769 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1769 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1769 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24642] The complementary binding of GAM1769 RNA, herein designated GAM RNA, to target binding sites on GAM1769 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1769 target RNA, herein designated GAM TARGET RNA, into GAM1769 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24643] It is appreciated that GAM1769 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1769 target genes. The mRNA of each one of this plurality of GAM1769 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1769 RNA, herein designated GAM RNA, and which when bound by GAM1769 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1769 target proteins.

[24644] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1769 gene, herein designated GAM GENE, on one or more GAM1769 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24645] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1769 correlate with, and may be deduced from, the identity of the target

genes which GAM1769 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24646] Nucleotide sequences of the GAM1769 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1769 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1769 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1769 are further described hereinbelow with reference to Table 1.

[24647] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1769 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24648] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1770 (GAM1770) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24649] GAM1770 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1770 was detected is described hereinabove with reference to Figs. 2-8.

[24650] GAM1770 gene, herein designated GAM GENE, and GAM1770 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[24651] GAM1770 gene, herein designated GAM GENE, encodes a GAM1770 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1770 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1770 precursor RNA is designated SEQ ID:1747, and is provided hereinbelow with reference to the sequence listing part.

[24652] GAM1770 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24653] An enzyme complex designated DICER COMPLEX, dices the GAM1770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1770 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1770 RNA is designated SEQ ID:4352, and is provided

hereinbelow with reference to the sequence listing part.

[24654] GAM1770 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1770 target RNA, herein designated GAM TARGET RNA. GAM1770 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24655] GAM1770 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1770 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1770 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1770 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1770 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24656] The complementary binding of GAM1770 RNA, herein designated GAM RNA, to target binding sites on GAM1770 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1770 target RNA, herein designated GAM TARGET RNA, into GAM1770 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24657] It is appreciated that GAM1770 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1770 target genes. The mRNA of each one of this plurality of GAM1770 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1770 RNA, herein designated GAM RNA, and which when bound by GAM1770 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1770 target proteins.

[24658] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1770 gene, herein designated GAM GENE, on one or more GAM1770 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24659] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1770 correlate with, and may be deduced from, the identity of the target genes which GAM1770 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24660] Nucleotide sequences of the GAM1770 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1770 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1770 are further described hereinbelow with reference to Table 1.

[24661] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1770 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24662] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1771 (GAM1771) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24663] GAM1771 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1771 was detected is described hereinabove with reference to Figs. 2-8.

[24664] GAM1771 gene, herein designated GAM GENE, and GAM1771 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24665] GAM1771 gene, herein designated GAM GENE, encodes a GAM1771 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1771 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1771 precursor RNA is designated SEQ ID:1748, and is provided hereinbelow with reference to the sequence listing part.

[24666] GAM1771 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1771 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24667] An enzyme complex designated DICER COMPLEX, dices the GAM1771 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1771 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1771 RNA is designated SEQ ID:4353, and is provided hereinbelow with reference to the sequence listing part.

[24668] GAM1771 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1771 target RNA, herein designated GAM TARGET RNA. GAM1771 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24669] GAM1771 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1771 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1771 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1771 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1771 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24670] The complementary binding of GAM1771 RNA, herein designated GAM RNA, to target binding sites on GAM1771 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1771 target RNA, herein designated GAM TARGET RNA, into GAM1771 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24671] It is appreciated that GAM1771 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1771 target genes. The mRNA of each one of this plurality of GAM1771 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1771 RNA, herein designated GAM RNA, and which when bound by GAM1771 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1771 target proteins.

[24672] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1771 gene, herein designated GAM GENE, on one or more GAM1771 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24673] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1771 correlate with, and may be deduced from, the identity of the target genes which GAM1771 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24674] Nucleotide sequences of the GAM1771 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1771 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1771 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1771 are further described hereinbelow with reference to Table 1.

[24675] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1771 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24676] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1772 (GAM1772) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24677] GAM1772 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1772 was detected is described hereinabove with reference to Figs. 2-8.

[24678] GAM1772 gene, herein designated GAM GENE, and GAM1772 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24679] GAM1772 gene, herein designated GAM GENE, encodes a GAM1772 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1772 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1772 precursor RNA is designated SEQ ID:1749, and is provided hereinbelow with reference to the sequence listing part.

[24680] GAM1772 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1772 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24681] An enzyme complex designated DICER COMPLEX, dices the GAM1772 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1772 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1772 RNA is designated SEQ ID:4354, and is provided hereinbelow with reference to the sequence listing part.

[24682] GAM1772 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1772 target RNA, herein designated GAM TARGET RNA. GAM1772 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24683] GAM1772 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1772 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1772 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1772 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1772 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24684] The complementary binding of GAM1772 RNA, herein designated GAM RNA, to target binding sites on GAM1772 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1772 target RNA, herein designated GAM TARGET RNA, into GAM1772 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24685] It is appreciated that GAM1772 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1772 target genes. The mRNA of each one of this plurality of GAM1772 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1772 RNA, herein designated GAM RNA, and which when bound by GAM1772 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1772 target proteins.

[24686] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1772 gene, herein designated GAM GENE, on one or more GAM1772 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24687] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1772 correlate with, and may be deduced from, the identity of the target genes which GAM1772 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24688] Nucleotide sequences of the GAM1772 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1772 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1772 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1772 are further described hereinbelow with reference to Table 1.

[24689] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1772 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[24690] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1773 (GAM1773) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24691] GAM1773 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1773 was detected is described hereinabove with reference to Figs. 2-8.

[24692] GAM1773 gene, herein designated GAM GENE, and GAM1773 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24693] GAM1773 gene, herein designated GAM GENE, encodes a GAM1773 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1773 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1773 precursor RNA is designated SEQ ID:1750, and is provided hereinbelow with reference to the sequence listing part.

[24694] GAM1773 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1773 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24695] An enzyme complex designated DICER COMPLEX, dices the GAM1773 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1773 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1773 RNA is designated SEQ ID:4355, and is provided hereinbelow with reference to the sequence listing part.

[24696] GAM1773 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1773 target RNA, herein designated GAM TARGET RNA. GAM1773 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24697] GAM1773 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1773 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1773 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1773 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1773 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24698] The complementary binding of GAM1773 RNA, herein designated GAM RNA, to target binding sites on GAM1773 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1773 target RNA, herein designated GAM TARGET RNA, into GAM1773 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24699] It is appreciated that GAM1773 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1773 target genes. The mRNA of each one of this plurality of GAM1773 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1773 RNA, herein designated GAM RNA, and which when bound by GAM1773 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1773 target proteins.

[24700] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1773 gene, herein designated GAM GENE, on one or more GAM1773 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24701] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1773 correlate with, and may be deduced from, the identity of the target genes which GAM1773 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24702] Nucleotide sequences of the GAM1773 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1773 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1773 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1773 are further described hereinbelow with reference to Table 1.

[24703] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1773 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24704] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1774 (GAM1774) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24705] GAM1774 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1774 was detected is described hereinabove with reference to Figs. 2-8.

[24706] GAM1774 gene, herein designated GAM GENE, and GAM1774 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24707] GAM1774 gene, herein designated GAM GENE, encodes a GAM1774 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1774 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1774 precursor RNA is designated SEQ ID:1751, and is provided hereinbelow with reference to the sequence listing part.

[24708] GAM1774 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1774 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24709] An enzyme complex designated DICER COMPLEX, dices the GAM1774 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1774 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1774 RNA is designated SEQ ID:4356, and is provided hereinbelow with reference to the sequence listing part.

[24710] GAM1774 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1774 target RNA, herein designated GAM TARGET RNA. GAM1774 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24711] GAM1774 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1774 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1774 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1774 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1774 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24712] The complementary binding of GAM1774 RNA, herein designated GAM RNA, to target binding sites on GAM1774 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1774 target RNA, herein designated GAM TARGET RNA, into GAM1774 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24713] It is appreciated that GAM1774 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1774 target genes. The

mRNA of each one of this plurality of GAM1774 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1774 RNA, herein designated GAM RNA, and which when bound by GAM1774 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1774 target proteins.

[24714] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1774 gene, herein designated GAM GENE, on one or more GAM1774 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24715] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1774 correlate with, and may be deduced from, the identity of the target genes which GAM1774 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24716] Nucleotide sequences of the GAM1774 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1774 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1774 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1774 are further described hereinbelow with reference to Table 1.

[24717] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1774 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24718] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1775 (GAM1775) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24719] GAM1775 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1775 was detected is described hereinabove with reference to Figs. 2-8.

[24720] GAM1775 gene, herein designated GAM GENE, and GAM1775 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24721] GAM1775 gene, herein designated GAM GENE, encodes a GAM1775 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1775 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1775 precursor RNA is designated SEQ ID:1752, and is provided hereinbelow with reference to the sequence listing part.

[24722] GAM1775 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1775 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24723] An enzyme complex designated DICER COMPLEX, dices the GAM1775 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1775 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1775 RNA is designated SEQ ID:4357, and is provided hereinbelow with reference to the sequence listing part.

[24724] GAM1775 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1775 target RNA, herein designated GAM TARGET RNA. GAM1775 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24725] GAM1775 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1775 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1775 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1775 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1775 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24726] The complementary binding of GAM1775 RNA, herein designated GAM RNA, to target binding sites on GAM1775 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1775 target RNA, herein designated GAM TARGET RNA, into GAM1775 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24727] It is appreciated that GAM1775 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1775 target genes. The mRNA of each one of this plurality of GAM1775 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1775 RNA, herein designated GAM RNA, and which when bound by GAM1775 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1775 target proteins.

[24728] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1775 gene, herein designated GAM GENE, on one or more GAM1775 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24729] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1775 correlate with, and may be deduced from, the identity of the target

genes which GAM1775 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24730] Nucleotide sequences of the GAM1775 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1775 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1775 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1775 are further described hereinbelow with reference to Table 1.

[24731] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1775 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24732] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1776 (GAM1776) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24733] GAM1776 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1776 was detected is described hereinabove with reference to Figs. 2-8.

[24734] GAM1776 gene, herein designated GAM GENE, and GAM1776 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[24735] GAM1776 gene, herein designated GAM GENE, encodes a GAM1776 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1776 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1776 precursor RNA is designated SEQ ID:1753, and is provided hereinbelow with reference to the sequence listing part.

[24736] GAM1776 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1776 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24737] An enzyme complex designated DICER COMPLEX, dices the GAM1776 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1776 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1776 RNA is designated SEQ ID:4358, and is provided

hereinbelow with reference to the sequence listing part.

[24738] GAM1776 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1776 target RNA, herein designated GAM TARGET RNA. GAM1776 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24739] GAM1776 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1776 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1776 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1776 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1776 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24740] The complementary binding of GAM1776 RNA, herein designated GAM RNA, to target binding sites on GAM1776 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1776 target RNA, herein designated GAM TARGET RNA, into GAM1776 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24741] It is appreciated that GAM1776 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1776 target genes. The mRNA of each one of this plurality of GAM1776 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1776 RNA, herein designated GAM RNA, and which when bound by GAM1776 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1776 target proteins.

[24742] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1776 gene, herein designated GAM GENE, on one or more GAM1776 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24743] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1776 correlate with, and may be deduced from, the identity of the target genes which GAM1776 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24744] Nucleotide sequences of the GAM1776 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1776 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1776 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1776 are further described hereinbelow with reference to Table 1.

[24745] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1776 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24746] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1777 (GAM1777) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24747] GAM1777 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1777 was detected is described hereinabove with reference to Figs. 2-8.

[24748] GAM1777 gene, herein designated GAM GENE, and GAM1777 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24749] GAM1777 gene, herein designated GAM GENE, encodes a GAM1777 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1777 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1777 precursor RNA is designated SEQ ID:1754, and is provided hereinbelow with reference to the sequence listing part.

[24750] GAM1777 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1777 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24751] An enzyme complex designated DICER COMPLEX, dices the GAM1777 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1777 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1777 RNA is designated SEQ ID:4360, and is provided hereinbelow with reference to the sequence listing part.

[24752] GAM1777 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1777 target RNA, herein designated GAM TARGET RNA. GAM1777 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24753] GAM1777 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1777 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1777 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1777 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1777 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24754] The complementary binding of GAM1777 RNA, herein designated GAM RNA, to target binding sites on GAM1777 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1777 target RNA, herein designated GAM TARGET RNA, into GAM1777 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24755] It is appreciated that GAM1777 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1777 target genes. The mRNA of each one of this plurality of GAM1777 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1777 RNA, herein designated GAM RNA, and which when bound by GAM1777 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1777 target proteins.

[24756] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1777 gene, herein designated GAM GENE, on one or more GAM1777 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24757] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1777 correlate with, and may be deduced from, the identity of the target genes which GAM1777 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24758] Nucleotide sequences of the GAM1777 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1777 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1777 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1777 are further described hereinbelow with reference to Table 1.

[24759] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1777 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24760] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1778 (GAM1778) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24761] GAM1778 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1778 was detected is described hereinabove with reference to Figs. 2-8.

[24762] GAM1778 gene, herein designated GAM GENE, and GAM1778 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24763] GAM1778 gene, herein designated GAM GENE, encodes a GAM1778 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1778 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1778 precursor RNA is designated SEQ ID:1755, and is provided hereinbelow with reference to the sequence listing part.

[24764] GAM1778 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1778 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24765] An enzyme complex designated DICER COMPLEX, dices the GAM1778 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1778 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1778 RNA is designated SEQ ID:4359, and is provided hereinbelow with reference to the sequence listing part.

[24766] GAM1778 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1778 target RNA, herein designated GAM TARGET RNA. GAM1778 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24767] GAM1778 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1778 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1778 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1778 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1778 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24768] The complementary binding of GAM1778 RNA, herein designated GAM RNA, to target binding sites on GAM1778 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1778 target RNA, herein designated GAM TARGET RNA, into GAM1778 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24769] It is appreciated that GAM1778 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1778 target genes. The mRNA of each one of this plurality of GAM1778 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1778 RNA, herein designated GAM RNA, and which when bound by GAM1778 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1778 target proteins.

[24770] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1778 gene, herein designated GAM GENE, on one or more GAM1778 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24771] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1778 correlate with, and may be deduced from, the identity of the target genes which GAM1778 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24772] Nucleotide sequences of the GAM1778 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1778 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1778 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1778 are further described hereinbelow with reference to Table 1.

[24773] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1778 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[24774] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1779 (GAM1779) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24775] GAM1779 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1779 was detected is described hereinabove with reference to Figs. 2-8.

[24776] GAM1779 gene, herein designated GAM GENE, and GAM1779 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24777] GAM1779 gene, herein designated GAM GENE, encodes a GAM1779 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1779 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1779 precursor RNA is designated SEQ ID:1756, and is provided hereinbelow with reference to the sequence listing part.

[24778] GAM1779 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1779 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24779] An enzyme complex designated DICER COMPLEX, dices the GAM1779 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1779 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1779 RNA is designated SEQ ID:4361, and is provided hereinbelow with reference to the sequence listing part.

[24780] GAM1779 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1779 target RNA, herein designated GAM TARGET RNA. GAM1779 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24781] GAM1779 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1779 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1779 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1779 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1779 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24782] The complementary binding of GAM1779 RNA, herein designated GAM RNA, to target binding sites on GAM1779 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1779 target RNA, herein designated GAM TARGET RNA, into GAM1779 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24783] It is appreciated that GAM1779 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1779 target genes. The mRNA of each one of this plurality of GAM1779 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1779 RNA, herein designated GAM RNA, and which when bound by GAM1779 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1779 target proteins.

[24784] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1779 gene, herein designated GAM GENE, on one or more GAM1779 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24785] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1779 correlate with, and may be deduced from, the identity of the target genes which GAM1779 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24786] Nucleotide sequences of the GAM1779 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1779 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1779 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1779 are further described hereinbelow with reference to Table 1.

[24787] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1779 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24788] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1780 (GAM1780) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24789] GAM1780 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1780 was detected is described hereinabove with reference to Figs. 2-8.

[24790] GAM1780 gene, herein designated GAM GENE, and GAM1780 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24791] GAM1780 gene, herein designated GAM GENE, encodes a GAM1780 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1780 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1780 precursor RNA is designated SEQ ID:1757, and is provided hereinbelow with reference to the sequence listing part.

[24792] GAM1780 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1780 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24793] An enzyme complex designated DICER COMPLEX, dices the GAM1780 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1780 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1780 RNA is designated SEQ ID:4362, and is provided hereinbelow with reference to the sequence listing part.

[24794] GAM1780 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1780 target RNA, herein designated GAM TARGET RNA. GAM1780 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24795] GAM1780 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1780 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1780 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1780 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1780 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24796] The complementary binding of GAM1780 RNA, herein designated GAM RNA, to target binding sites on GAM1780 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1780 target RNA, herein designated GAM TARGET RNA, into GAM1780 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24797] It is appreciated that GAM1780 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1780 target genes. The

mRNA of each one of this plurality of GAM1780 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1780 RNA, herein designated GAM RNA, and which when bound by GAM1780 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1780 target proteins.

[24798] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1780 gene, herein designated GAM GENE, on one or more GAM1780 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24799] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1780 correlate with, and may be deduced from, the identity of the target genes which GAM1780 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24800] Nucleotide sequences of the GAM1780 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1780 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1780 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1780 are further described hereinbelow with reference to Table 1.

[24801] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1780 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24802] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1781 (GAM1781) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24803] GAM1781 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1781 was detected is described hereinabove with reference to Figs. 2-8.

[24804] GAM1781 gene, herein designated GAM GENE, and GAM1781 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24805] GAM1781 gene, herein designated GAM GENE, encodes a GAM1781 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1781 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1781 precursor RNA is designated SEQ ID:1758, and is provided hereinbelow with reference to the sequence listing part.

[24806] GAM1781 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1781 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24807] An enzyme complex designated DICER COMPLEX, dices the GAM1781 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1781 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1781 RNA is designated SEQ ID:4363, and is provided hereinbelow with reference to the sequence listing part.

[24808] GAM1781 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1781 target RNA, herein designated GAM TARGET RNA. GAM1781 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24809] GAM1781 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1781 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1781 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1781 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1781 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24810] The complementary binding of GAM1781 RNA, herein designated GAM RNA, to target binding sites on GAM1781 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1781 target RNA, herein designated GAM TARGET RNA, into GAM1781 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24811] It is appreciated that GAM1781 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1781 target genes. The mRNA of each one of this plurality of GAM1781 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1781 RNA, herein designated GAM RNA, and which when bound by GAM1781 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1781 target proteins.

[24812] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1781 gene, herein designated GAM GENE, on one or more GAM1781 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24813] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1781 correlate with, and may be deduced from, the identity of the target

genes which GAM1781 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24814] Nucleotide sequences of the GAM1781 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1781 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1781 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1781 are further described hereinbelow with reference to Table 1.

[24815] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1781 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24816] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1782 (GAM1782) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24817] GAM1782 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1782 was detected is described hereinabove with reference to Figs. 2-8.

[24818] GAM1782 gene, herein designated GAM GENE, and GAM1782 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[24819] GAM1782 gene, herein designated GAM GENE, encodes a GAM1782 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1782 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1782 precursor RNA is designated SEQ ID:1759, and is provided hereinbelow with reference to the sequence listing part.

[24820] GAM1782 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1782 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24821] An enzyme complex designated DICER COMPLEX, dices the GAM1782 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1782 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1782 RNA is designated SEQ ID:4365, and is provided

hereinbelow with reference to the sequence listing part.

[24822] GAM1782 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1782 target RNA, herein designated GAM TARGET RNA. GAM1782 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24823] GAM1782 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1782 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1782 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1782 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1782 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24824] The complementary binding of GAM1782 RNA, herein designated GAM RNA, to target binding sites on GAM1782 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1782 target RNA, herein designated GAM TARGET RNA, into GAM1782 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24825] It is appreciated that GAM1782 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1782 target genes. The mRNA of each one of this plurality of GAM1782 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1782 RNA, herein designated GAM RNA, and which when bound by GAM1782 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1782 target proteins.

[24826] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1782 gene, herein designated GAM GENE, on one or more GAM1782 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24827] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1782 correlate with, and may be deduced from, the identity of the target genes which GAM1782 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24828] Nucleotide sequences of the GAM1782 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1782 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1782 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1782 are further described hereinbelow with reference to Table 1.

[24829] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1782 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24830] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1783 (GAM1783) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24831] GAM1783 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1783 was detected is described hereinabove with reference to Figs. 2-8.

[24832] GAM1783 gene, herein designated GAM GENE, and GAM1783 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24833] GAM1783 gene, herein designated GAM GENE, encodes a GAM1783 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1783 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1783 precursor RNA is designated SEQ ID:1760, and is provided hereinbelow with reference to the sequence listing part.

[24834] GAM1783 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1783 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24835] An enzyme complex designated DICER COMPLEX, dices the GAM1783 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1783 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM1783 RNA is designated SEQ ID:4364, and is provided hereinbelow with reference to the sequence listing part.

[24836] GAM1783 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1783 target RNA, herein designated GAM TARGET RNA. GAM1783 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24837] GAM1783 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1783 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1783 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1783 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1783 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24838] The complementary binding of GAM1783 RNA, herein designated GAM RNA, to target binding sites on GAM1783 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1783 target RNA, herein designated GAM TARGET RNA, into GAM1783 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24839] It is appreciated that GAM1783 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1783 target genes. The mRNA of each one of this plurality of GAM1783 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1783 RNA, herein designated GAM RNA, and which when bound by GAM1783 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1783 target proteins.

[24840] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1783 gene, herein designated GAM GENE, on one or more GAM1783 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24841] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1783 correlate with, and may be deduced from, the identity of the target genes which GAM1783 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24842] Nucleotide sequences of the GAM1783 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1783 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1783 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1783 are further described hereinbelow with reference to Table 1.

[24843] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1783 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24844] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1784 (GAM1784) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24845] GAM1784 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1784 was detected is described hereinabove with reference to Figs. 2-8.

[24846] GAM1784 gene, herein designated GAM GENE, and GAM1784 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24847] GAM1784 gene, herein designated GAM GENE, encodes a GAM1784 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1784 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1784 precursor RNA is designated SEQ ID:1761, and is provided hereinbelow with reference to the sequence listing part.

[24848] GAM1784 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1784 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24849] An enzyme complex designated DICER COMPLEX, dices the GAM1784 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1784 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1784 RNA is designated SEQ ID:4366, and is provided hereinbelow with reference to the sequence listing part.

[24850] GAM1784 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1784 target RNA, herein designated GAM TARGET RNA. GAM1784 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24851] GAM1784 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1784 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1784 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1784 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1784 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24852] The complementary binding of GAM1784 RNA, herein designated GAM RNA, to target binding sites on GAM1784 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1784 target RNA, herein designated GAM TARGET RNA, into GAM1784 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24853] It is appreciated that GAM1784 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1784 target genes. The mRNA of each one of this plurality of GAM1784 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1784 RNA, herein designated GAM RNA, and which when bound by GAM1784 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1784 target proteins.

[24854] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1784 gene, herein designated GAM GENE, on one or more GAM1784 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24855] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1784 correlate with, and may be deduced from, the identity of the target genes which GAM1784 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24856] Nucleotide sequences of the GAM1784 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1784 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1784 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1784 are further described hereinbelow with reference to Table 1.

[24857] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1784 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[24858] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1785 (GAM1785) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24859] GAM1785 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1785 was detected is described hereinabove with reference to Figs. 2-8.

[24860] GAM1785 gene, herein designated GAM GENE, and GAM1785 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24861] GAM1785 gene, herein designated GAM GENE, encodes a GAM1785 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1785 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1785 precursor RNA is designated SEQ ID:1762, and is provided hereinbelow with reference to the sequence listing part.

[24862] GAM1785 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1785 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24863] An enzyme complex designated DICER COMPLEX, dices the GAM1785 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1785 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1785 RNA is designated SEQ ID:4367, and is provided hereinbelow with reference to the sequence listing part.

[24864] GAM1785 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1785 target RNA, herein designated GAM TARGET RNA. GAM1785 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24865] GAM1785 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1785 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1785 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1785 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1785 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24866] The complementary binding of GAM1785 RNA, herein designated GAM RNA, to target binding sites on GAM1785 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1785 target RNA, herein designated GAM TARGET RNA, into GAM1785 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24867] It is appreciated that GAM1785 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1785 target genes. The mRNA of each one of this plurality of GAM1785 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1785 RNA, herein designated GAM RNA, and which when bound by GAM1785 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1785 target proteins.

[24868] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1785 gene, herein designated GAM GENE, on one or more GAM1785 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24869] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1785 correlate with, and may be deduced from, the identity of the target genes which GAM1785 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24870] Nucleotide sequences of the GAM1785 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1785 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1785 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1785 are further described hereinbelow with reference to Table 1.

[24871] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1785 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24872] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1786 (GAM1786) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24873] GAM1786 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1786 was detected is described hereinabove with reference to Figs. 2-8.

[24874] GAM1786 gene, herein designated GAM GENE, and GAM1786 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24875] GAM1786 gene, herein designated GAM GENE, encodes a GAM1786 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1786 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1786 precursor RNA is designated SEQ ID:1763, and is provided hereinbelow with reference to the sequence listing part.

[24876] GAM1786 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1786 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24877] An enzyme complex designated DICER COMPLEX, dices the GAM1786 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1786 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1786 RNA is designated SEQ ID:4368, and is provided hereinbelow with reference to the sequence listing part.

[24878] GAM1786 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1786 target RNA, herein designated GAM TARGET RNA. GAM1786 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24879] GAM1786 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1786 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1786 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1786 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1786 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24880] The complementary binding of GAM1786 RNA, herein designated GAM RNA, to target binding sites on GAM1786 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1786 target RNA, herein designated GAM TARGET RNA, into GAM1786 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24881] It is appreciated that GAM1786 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1786 target genes. The

mRNA of each one of this plurality of GAM1786 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1786 RNA, herein designated GAM RNA, and which when bound by GAM1786 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1786 target proteins.

[24882] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1786 gene, herein designated GAM GENE, on one or more GAM1786 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24883] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1786 correlate with, and may be deduced from, the identity of the target genes which GAM1786 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24884] Nucleotide sequences of the GAM1786 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1786 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1786 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1786 are further described hereinbelow with reference to Table 1.

[24885] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1786 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24886] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1787 (GAM1787) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24887] GAM1787 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1787 was detected is described hereinabove with reference to Figs. 2-8.

[24888] GAM1787 gene, herein designated GAM GENE, and GAM1787 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24889] GAM1787 gene, herein designated GAM GENE, encodes a GAM1787 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1787 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1787 precursor RNA is designated SEQ ID:1764, and is provided hereinbelow with reference to the sequence listing part.

[24890] GAM1787 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1787 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24891] An enzyme complex designated DICER COMPLEX, dices the GAM1787 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1787 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1787 RNA is designated SEQ ID:4369, and is provided hereinbelow with reference to the sequence listing part.

[24892] GAM1787 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1787 target RNA, herein designated GAM TARGET RNA. GAM1787 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24893] GAM1787 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1787 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1787 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1787 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1787 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24894] The complementary binding of GAM1787 RNA, herein designated GAM RNA, to target binding sites on GAM1787 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1787 target RNA, herein designated GAM TARGET RNA, into GAM1787 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24895] It is appreciated that GAM1787 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1787 target genes. The mRNA of each one of this plurality of GAM1787 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1787 RNA, herein designated GAM RNA, and which when bound by GAM1787 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1787 target proteins.

[24896] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1787 gene, herein designated GAM GENE, on one or more GAM1787 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24897] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1787 correlate with, and may be deduced from, the identity of the target

genes which GAM1787 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24898] Nucleotide sequences of the GAM1787 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1787 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1787 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1787 are further described hereinbelow with reference to Table 1.

[24899] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1787 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24900] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1788 (GAM1788) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24901] GAM1788 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1788 was detected is described hereinabove with reference to Figs. 2-8.

[24902] GAM1788 gene, herein designated GAM GENE, and GAM1788 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[24903] GAM1788 gene, herein designated GAM GENE, encodes a GAM1788 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1788 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1788 precursor RNA is designated SEQ ID:1765, and is provided hereinbelow with reference to the sequence listing part.

[24904] GAM1788 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1788 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24905] An enzyme complex designated DICER COMPLEX, dices the GAM1788 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1788 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1788 RNA is designated SEQ ID:4370, and is provided

hereinbelow with reference to the sequence listing part.

[24906] GAM1788 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1788 target RNA, herein designated GAM TARGET RNA. GAM1788 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24907] GAM1788 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1788 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1788 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1788 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1788 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24908] The complementary binding of GAM1788 RNA, herein designated GAM RNA, to target binding sites on GAM1788 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1788 target RNA, herein designated GAM TARGET RNA, into GAM1788 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24909] It is appreciated that GAM1788 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1788 target genes. The mRNA of each one of this plurality of GAM1788 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1788 RNA, herein designated GAM RNA, and which when bound by GAM1788 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1788 target proteins.

[24910] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1788 gene, herein designated GAM GENE, on one or more GAM1788 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24911] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1788 correlate with, and may be deduced from, the identity of the target genes which GAM1788 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24912] Nucleotide sequences of the GAM1788 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1788 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1788 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1788 are further described hereinbelow with reference to Table 1.

[24913] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1788 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24914] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1789 (GAM1789) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24915] GAM1789 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1789 was detected is described hereinabove with reference to Figs. 2-8.

[24916] GAM1789 gene, herein designated GAM GENE, and GAM1789 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24917] GAM1789 gene, herein designated GAM GENE, encodes a GAM1789 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1789 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1789 precursor RNA is designated SEQ ID:1766, and is provided hereinbelow with reference to the sequence listing part.

[24918] GAM1789 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1789 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24919] An enzyme complex designated DICER COMPLEX, dices the GAM1789 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1789 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM1789 RNA is designated SEQ ID:4372, and is provided hereinbelow with reference to the sequence listing part.

[24920] GAM1789 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1789 target RNA, herein designated GAM TARGET RNA. GAM1789 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24921] GAM1789 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1789 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1789 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1789 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1789 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24922] The complementary binding of GAM1789 RNA, herein designated GAM RNA, to target binding sites on GAM1789 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1789 target RNA, herein designated GAM TARGET RNA, into GAM1789 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24923] It is appreciated that GAM1789 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1789 target genes. The mRNA of each one of this plurality of GAM1789 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1789 RNA, herein designated GAM RNA, and which when bound by GAM1789 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1789 target proteins.

[24924] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1789 gene, herein designated GAM GENE, on one or more GAM1789 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24925] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1789 correlate with, and may be deduced from, the identity of the target genes which GAM1789 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24926] Nucleotide sequences of the GAM1789 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1789 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1789 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1789 are further described hereinbelow with reference to Table 1.

[24927] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1789 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24928] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1790 (GAM1790) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24929] GAM1790 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1790 was detected is described hereinabove with reference to Figs. 2-8.

[24930] GAM1790 gene, herein designated GAM GENE, and GAM1790 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24931] GAM1790 gene, herein designated GAM GENE, encodes a GAM1790 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1790 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1790 precursor RNA is designated SEQ ID:1767, and is provided hereinbelow with reference to the sequence listing part.

[24932] GAM1790 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1790 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24933] An enzyme complex designated DICER COMPLEX, dices the GAM1790 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1790 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1790 RNA is designated SEQ ID:4371, and is provided hereinbelow with reference to the sequence listing part.

[24934] GAM1790 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1790 target RNA, herein designated GAM TARGET RNA. GAM1790 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24935] GAM1790 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1790 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1790 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1790 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1790 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24936] The complementary binding of GAM1790 RNA, herein designated GAM RNA, to target binding sites on GAM1790 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1790 target RNA, herein designated GAM TARGET RNA, into GAM1790 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24937] It is appreciated that GAM1790 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1790 target genes. The mRNA of each one of this plurality of GAM1790 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1790 RNA, herein designated GAM RNA, and which when bound by GAM1790 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1790 target proteins.

[24938] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1790 gene, herein designated GAM GENE, on one or more GAM1790 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24939] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1790 correlate with, and may be deduced from, the identity of the target genes which GAM1790 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24940] Nucleotide sequences of the GAM1790 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1790 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1790 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1790 are further described hereinbelow with reference to Table 1.

[24941] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1790 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[24942] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1791 (GAM1791) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24943] GAM1791 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1791 was detected is described hereinabove with reference to Figs. 2-8.

[24944] GAM1791 gene, herein designated GAM GENE, and GAM1791 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24945] GAM1791 gene, herein designated GAM GENE, encodes a GAM1791 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1791 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1791 precursor RNA is designated SEQ ID:1768, and is provided hereinbelow with reference to the sequence listing part.

[24946] GAM1791 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1791 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24947] An enzyme complex designated DICER COMPLEX, dices the GAM1791 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1791 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1791 RNA is designated SEQ ID:4373, and is provided hereinbelow with reference to the sequence listing part.

[24948] GAM1791 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1791 target RNA, herein designated GAM TARGET RNA. GAM1791 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24949] GAM1791 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1791 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1791 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1791 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1791 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24950] The complementary binding of GAM1791 RNA, herein designated GAM RNA, to target binding sites on GAM1791 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1791 target RNA, herein designated GAM TARGET RNA, into GAM1791 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24951] It is appreciated that GAM1791 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1791 target genes. The mRNA of each one of this plurality of GAM1791 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1791 RNA, herein designated GAM RNA, and which when bound by GAM1791 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1791 target proteins.

[24952] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1791 gene, herein designated GAM GENE, on one or more GAM1791 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24953] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1791 correlate with, and may be deduced from, the identity of the target genes which GAM1791 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24954] Nucleotide sequences of the GAM1791 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1791 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1791 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1791 are further described hereinbelow with reference to Table 1.

[24955] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1791 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24956] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1792 (GAM1792) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24957] GAM1792 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1792 was detected is described hereinabove with reference to Figs. 2-8.

[24958] GAM1792 gene, herein designated GAM GENE, and GAM1792 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24959] GAM1792 gene, herein designated GAM GENE, encodes a GAM1792 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1792 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1792 precursor RNA is designated SEQ ID:1769, and is provided hereinbelow with reference to the sequence listing part.

[24960] GAM1792 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1792 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24961] An enzyme complex designated DICER COMPLEX, dices the GAM1792 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1792 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1792 RNA is designated SEQ ID:4374, and is provided hereinbelow with reference to the sequence listing part.

[24962] GAM1792 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1792 target RNA, herein designated GAM TARGET RNA. GAM1792 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24963] GAM1792 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1792 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1792 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1792 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1792 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24964] The complementary binding of GAM1792 RNA, herein designated GAM RNA, to target binding sites on GAM1792 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1792 target RNA, herein designated GAM TARGET RNA, into GAM1792 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24965] It is appreciated that GAM1792 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1792 target genes. The

mRNA of each one of this plurality of GAM1792 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1792 RNA, herein designated GAM RNA, and which when bound by GAM1792 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1792 target proteins.

[24966] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1792 gene, herein designated GAM GENE, on one or more GAM1792 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24967] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1792 correlate with, and may be deduced from, the identity of the target genes which GAM1792 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24968] Nucleotide sequences of the GAM1792 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1792 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1792 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1792 are further described hereinbelow with reference to Table 1.

[24969] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1792 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24970] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1793 (GAM1793) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24971] GAM1793 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1793 was detected is described hereinabove with reference to Figs. 2-8.

[24972] GAM1793 gene, herein designated GAM GENE, and GAM1793 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[24973] GAM1793 gene, herein designated GAM GENE, encodes a GAM1793 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1793 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1793 precursor RNA is designated SEQ ID:1770, and is provided hereinbelow with reference to the sequence listing part.

[24974] GAM1793 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1793 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24975] An enzyme complex designated DICER COMPLEX, dices the GAM1793 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1793 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1793 RNA is designated SEQ ID:4375, and is provided hereinbelow with reference to the sequence listing part.

[24976] GAM1793 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1793 target RNA, herein designated GAM TARGET RNA. GAM1793 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24977] GAM1793 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1793 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1793 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1793 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1793 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24978] The complementary binding of GAM1793 RNA, herein designated GAM RNA, to target binding sites on GAM1793 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1793 target RNA, herein designated GAM TARGET RNA, into GAM1793 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24979] It is appreciated that GAM1793 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1793 target genes. The mRNA of each one of this plurality of GAM1793 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1793 RNA, herein designated GAM RNA, and which when bound by GAM1793 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1793 target proteins.

[24980] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1793 gene, herein designated GAM GENE, on one or more GAM1793 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24981] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1793 correlate with, and may be deduced from, the identity of the target

genes which GAM1793 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24982] Nucleotide sequences of the GAM1793 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1793 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1793 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1793 are further described hereinbelow with reference to Table 1.

[24983] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1793 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24984] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1794 (GAM1794) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24985] GAM1794 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1794 was detected is described hereinabove with reference to Figs. 2-8.

[24986] GAM1794 gene, herein designated GAM GENE, and GAM1794 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[24987] GAM1794 gene, herein designated GAM GENE, encodes a GAM1794 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1794 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1794 precursor RNA is designated SEQ ID:1771, and is provided hereinbelow with reference to the sequence listing part.

[24988] GAM1794 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1794 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24989] An enzyme complex designated DICER COMPLEX, dices the GAM1794 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1794 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1794 RNA is designated SEQ ID:4376, and is provided

hereinbelow with reference to the sequence listing part.

[24990] GAM1794 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1794 target RNA, herein designated GAM TARGET RNA. GAM1794 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[24991] GAM1794 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1794 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1794 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1794 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1794 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[24992] The complementary binding of GAM1794 RNA, herein designated GAM RNA, to target binding sites on GAM1794 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1794 target RNA, herein designated GAM TARGET RNA, into GAM1794 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[24993] It is appreciated that GAM1794 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1794 target genes. The mRNA of each one of this plurality of GAM1794 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1794 RNA, herein designated GAM RNA, and which when bound by GAM1794 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1794 target proteins.

[24994] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1794 gene, herein designated GAM GENE, on one or more GAM1794 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[24995] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1794 correlate with, and may be deduced from, the identity of the target genes which GAM1794 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24996] Nucleotide sequences of the GAM1794 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1794 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1794 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1794 are further described hereinbelow with reference to Table 1.

[24997] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1794 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[24998] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1795 (GAM1795) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[24999] GAM1795 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1795 was detected is described hereinabove with reference to Figs. 2-8.

[25000] GAM1795 gene, herein designated GAM GENE, and GAM1795 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25001] GAM1795 gene, herein designated GAM GENE, encodes a GAM1795 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1795 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1795 precursor RNA is designated SEQ ID:1772, and is provided hereinbelow with reference to the sequence listing part.

[25002] GAM1795 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1795 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25003] An enzyme complex designated DICER COMPLEX, dices the GAM1795 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1795 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1795 RNA is designated SEQ ID:4377, and is provided hereinbelow with reference to the sequence listing part.

[25004] GAM1795 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1795 target RNA, herein designated GAM TARGET RNA. GAM1795 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25005] GAM1795 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1795 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1795 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1795 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1795 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25006] The complementary binding of GAM1795 RNA, herein designated GAM RNA, to target binding sites on GAM1795 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1795 target RNA, herein designated GAM TARGET RNA, into GAM1795 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25007] It is appreciated that GAM1795 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1795 target genes. The mRNA of each one of this plurality of GAM1795 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1795 RNA, herein designated GAM RNA, and which when bound by GAM1795 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1795 target proteins.

[25008] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1795 gene, herein designated GAM GENE, on one or more GAM1795 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25009] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1795 correlate with, and may be deduced from, the identity of the target genes which GAM1795 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25010] Nucleotide sequences of the GAM1795 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1795 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1795 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1795 are further described hereinbelow with reference to Table 1.

[25011] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1795 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25012] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1796 (GAM1796) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25013] GAM1796 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1796 was detected is described hereinabove with reference to Figs. 2-8.

[25014] GAM1796 gene, herein designated GAM GENE, and GAM1796 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25015] GAM1796 gene, herein designated GAM GENE, encodes a GAM1796 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1796 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1796 precursor RNA is designated SEQ ID:1773, and is provided hereinbelow with reference to the sequence listing part.

[25016] GAM1796 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1796 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25017] An enzyme complex designated DICER COMPLEX, dices the GAM1796 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1796 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1796 RNA is designated SEQ ID:4378, and is provided hereinbelow with reference to the sequence listing part.

[25018] GAM1796 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1796 target RNA, herein designated GAM TARGET RNA. GAM1796 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25019] GAM1796 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1796 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1796 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1796 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1796 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25020] The complementary binding of GAM1796 RNA, herein designated GAM RNA, to target binding sites on GAM1796 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1796 target RNA, herein designated GAM TARGET RNA, into GAM1796 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25021] It is appreciated that GAM1796 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1796 target genes. The mRNA of each one of this plurality of GAM1796 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1796 RNA, herein designated GAM RNA, and which when bound by GAM1796 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1796 target proteins.

[25022] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1796 gene, herein designated GAM GENE, on one or more GAM1796 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25023] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1796 correlate with, and may be deduced from, the identity of the target genes which GAM1796 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25024] Nucleotide sequences of the GAM1796 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1796 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1796 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1796 are further described hereinbelow with reference to Table 1.

[25025] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1796 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[25026] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1797 (GAM1797) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25027] GAM1797 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1797 was detected is described hereinabove with reference to Figs. 2-8.

[25028] GAM1797 gene, herein designated GAM GENE, and GAM1797 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25029] GAM1797 gene, herein designated GAM GENE, encodes a GAM1797 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1797 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1797 precursor RNA is designated SEQ ID:1774, and is provided hereinbelow with reference to the sequence listing part.

[25030] GAM1797 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1797 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25031] An enzyme complex designated DICER COMPLEX, dices the GAM1797 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1797 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1797 RNA is designated SEQ ID:4379, and is provided hereinbelow with reference to the sequence listing part.

[25032] GAM1797 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1797 target RNA, herein designated GAM TARGET RNA. GAM1797 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25033] GAM1797 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1797 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1797 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1797 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1797 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25034] The complementary binding of GAM1797 RNA, herein designated GAM RNA, to target binding sites on GAM1797 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1797 target RNA, herein designated GAM TARGET RNA, into GAM1797 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25035] It is appreciated that GAM1797 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1797 target genes. The mRNA of each one of this plurality of GAM1797 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1797 RNA, herein designated GAM RNA, and which when bound by GAM1797 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1797 target proteins.

[25036] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1797 gene, herein designated GAM GENE, on one or more GAM1797 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25037] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1797 correlate with, and may be deduced from, the identity of the target genes which GAM1797 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25038] Nucleotide sequences of the GAM1797 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1797 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1797 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1797 are further described hereinbelow with reference to Table 1.

[25039] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1797 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25040] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1798 (GAM1798) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25041] GAM1798 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1798 was detected is described hereinabove with reference to Figs. 2-8.

[25042] GAM1798 gene, herein designated GAM GENE, and GAM1798 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25043] GAM1798 gene, herein designated GAM GENE, encodes a GAM1798 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1798 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1798 precursor RNA is designated SEQ ID:1775, and is provided hereinbelow with reference to the sequence listing part.

[25044] GAM1798 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1798 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25045] An enzyme complex designated DICER COMPLEX, dices the GAM1798 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1798 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1798 RNA is designated SEQ ID:4380, and is provided hereinbelow with reference to the sequence listing part.

[25046] GAM1798 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1798 target RNA, herein designated GAM TARGET RNA. GAM1798 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25047] GAM1798 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1798 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1798 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1798 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1798 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25048] The complementary binding of GAM1798 RNA, herein designated GAM RNA, to target binding sites on GAM1798 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1798 target RNA, herein designated GAM TARGET RNA, into GAM1798 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25049] It is appreciated that GAM1798 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1798 target genes. The

mRNA of each one of this plurality of GAM1798 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1798 RNA, herein designated GAM RNA, and which when bound by GAM1798 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1798 target proteins.

[25050] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1798 gene, herein designated GAM GENE, on one or more GAM1798 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25051] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1798 correlate with, and may be deduced from, the identity of the target genes which GAM1798 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25052] Nucleotide sequences of the GAM1798 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1798 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1798 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1798 are further described hereinbelow with reference to Table 1.

[25053] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1798 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25054] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1799 (GAM1799) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25055] GAM1799 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1799 was detected is described hereinabove with reference to Figs. 2-8.

[25056] GAM1799 gene, herein designated GAM GENE, and GAM1799 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25057] GAM1799 gene, herein designated GAM GENE, encodes a GAM1799 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1799 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1799 precursor RNA is designated SEQ ID:1776, and is provided hereinbelow with reference to the sequence listing part.

[25058] GAM1799 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25059] An enzyme complex designated DICER COMPLEX, dices the GAM1799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1799 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1799 RNA is designated SEQ ID:4381, and is provided hereinbelow with reference to the sequence listing part.

[25060] GAM1799 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1799 target RNA, herein designated GAM TARGET RNA. GAM1799 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25061] GAM1799 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1799 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1799 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1799 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1799 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25062] The complementary binding of GAM1799 RNA, herein designated GAM RNA, to target binding sites on GAM1799 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1799 target RNA, herein designated GAM TARGET RNA, into GAM1799 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25063] It is appreciated that GAM1799 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1799 target genes. The mRNA of each one of this plurality of GAM1799 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1799 RNA, herein designated GAM RNA, and which when bound by GAM1799 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1799 target proteins.

[25064] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1799 gene, herein designated GAM GENE, on one or more GAM1799 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25065] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1799 correlate with, and may be deduced from, the identity of the target

genes which GAM1799 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25066] Nucleotide sequences of the GAM1799 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1799 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1799 are further described hereinbelow with reference to Table 1.

[25067] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1799 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25068] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1800 (GAM1800) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25069] GAM1800 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1800 was detected is described hereinabove with reference to Figs. 2-8.

[25070] GAM1800 gene, herein designated GAM GENE, and GAM1800 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[25071] GAM1800 gene, herein designated GAM GENE, encodes a GAM1800 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1800 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1800 precursor RNA is designated SEQ ID:1777, and is provided hereinbelow with reference to the sequence listing part.

[25072] GAM1800 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25073] An enzyme complex designated DICER COMPLEX, dices the GAM1800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1800 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1800 RNA is designated SEQ ID:4382, and is provided

hereinbelow with reference to the sequence listing part.

[25074] GAM1800 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1800 target RNA, herein designated GAM TARGET RNA. GAM1800 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25075] GAM1800 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1800 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1800 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1800 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1800 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25076] The complementary binding of GAM1800 RNA, herein designated GAM RNA, to target binding sites on GAM1800 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1800 target RNA, herein designated GAM TARGET RNA, into GAM1800 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25077] It is appreciated that GAM1800 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1800 target genes. The mRNA of each one of this plurality of GAM1800 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1800 RNA, herein designated GAM RNA, and which when bound by GAM1800 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1800 target proteins.

[25078] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1800 gene, herein designated GAM GENE, on one or more GAM1800 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25079] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1800 correlate with, and may be deduced from, the identity of the target genes which GAM1800 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25080] Nucleotide sequences of the GAM1800 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1800 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1800 are further described hereinbelow with reference to Table 1.

[25081] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1800 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25082] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1801 (GAM1801) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25083] GAM1801 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1801 was detected is described hereinabove with reference to Figs. 2-8.

[25084] GAM1801 gene, herein designated GAM GENE, and GAM1801 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25085] GAM1801 gene, herein designated GAM GENE, encodes a GAM1801 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1801 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1801 precursor RNA is designated SEQ ID:1778, and is provided hereinbelow with reference to the sequence listing part.

[25086] GAM1801 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1801 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25087] An enzyme complex designated DICER COMPLEX, dices the GAM1801 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1801 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1801 RNA is designated SEQ ID:4383, and is provided hereinbelow with reference to the sequence listing part.

[25088] GAM1801 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1801 target RNA, herein designated GAM TARGET RNA. GAM1801 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25089] GAM1801 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1801 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1801 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1801 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1801 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25090] The complementary binding of GAM1801 RNA, herein designated GAM RNA, to target binding sites on GAM1801 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1801 target RNA, herein designated GAM TARGET RNA, into GAM1801 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25091] It is appreciated that GAM1801 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1801 target genes. The mRNA of each one of this plurality of GAM1801 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1801 RNA, herein designated GAM RNA, and which when bound by GAM1801 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1801 target proteins.

[25092] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1801 gene, herein designated GAM GENE, on one or more GAM1801 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25093] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1801 correlate with, and may be deduced from, the identity of the target genes which GAM1801 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25094] Nucleotide sequences of the GAM1801 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1801 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1801 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1801 are further described hereinbelow with reference to Table 1.

[25095] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1801 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25096] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1802 (GAM1802) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25097] GAM1802 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1802 was detected is described hereinabove with reference to Figs. 2-8.

[25098] GAM1802 gene, herein designated GAM GENE, and GAM1802 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25099] GAM1802 gene, herein designated GAM GENE, encodes a GAM1802 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1802 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1802 precursor RNA is designated SEQ ID:1779, and is provided hereinbelow with reference to the sequence listing part.

[25100] GAM1802 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1802 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25101] An enzyme complex designated DICER COMPLEX, dices the GAM1802 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1802 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1802 RNA is designated SEQ ID:4384, and is provided hereinbelow with reference to the sequence listing part.

[25102] GAM1802 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1802 target RNA, herein designated GAM TARGET RNA. GAM1802 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25103] GAM1802 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1802 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1802 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1802 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1802 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25104] The complementary binding of GAM1802 RNA, herein designated GAM RNA, to target binding sites on GAM1802 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1802 target RNA, herein designated GAM TARGET RNA, into GAM1802 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25105] It is appreciated that GAM1802 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1802 target genes. The mRNA of each one of this plurality of GAM1802 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1802 RNA, herein designated GAM RNA, and which when bound by GAM1802 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1802 target proteins.

[25106] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1802 gene, herein designated GAM GENE, on one or more GAM1802 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25107] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1802 correlate with, and may be deduced from, the identity of the target genes which GAM1802 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25108] Nucleotide sequences of the GAM1802 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1802 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1802 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1802 are further described hereinbelow with reference to Table 1.

[25109] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1802 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[25110] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1803 (GAM1803) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25111] GAM1803 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1803 was detected is described hereinabove with reference to Figs. 2-8.

[25112] GAM1803 gene, herein designated GAM GENE, and GAM1803 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25113] GAM1803 gene, herein designated GAM GENE, encodes a GAM1803 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1803 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1803 precursor RNA is designated SEQ ID:1780, and is provided hereinbelow with reference to the sequence listing part.

[25114] GAM1803 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1803 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25115] An enzyme complex designated DICER COMPLEX, dices the GAM1803 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1803 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1803 RNA is designated SEQ ID:4385, and is provided hereinbelow with reference to the sequence listing part.

[25116] GAM1803 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1803 target RNA, herein designated GAM TARGET RNA. GAM1803 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25117] GAM1803 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1803 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1803 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1803 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1803 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25118] The complementary binding of GAM1803 RNA, herein designated GAM RNA, to target binding sites on GAM1803 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1803 target RNA, herein designated GAM TARGET RNA, into GAM1803 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25119] It is appreciated that GAM1803 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1803 target genes. The mRNA of each one of this plurality of GAM1803 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1803 RNA, herein designated GAM RNA, and which when bound by GAM1803 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1803 target proteins.

[25120] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1803 gene, herein designated GAM GENE, on one or more GAM1803 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25121] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1803 correlate with, and may be deduced from, the identity of the target genes which GAM1803 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25122] Nucleotide sequences of the GAM1803 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1803 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1803 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1803 are further described hereinbelow with reference to Table 1.

[25123] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1803 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25124] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1804 (GAM1804) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25125] GAM1804 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1804 was detected is described hereinabove with reference to Figs. 2-8.

[25126] GAM1804 gene, herein designated GAM GENE, and GAM1804 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25127] GAM1804 gene, herein designated GAM GENE, encodes a GAM1804 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1804 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1804 precursor RNA is designated SEQ ID:1781, and is provided hereinbelow with reference to the sequence listing part.

[25128] GAM1804 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1804 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25129] An enzyme complex designated DICER COMPLEX, dices the GAM1804 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1804 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1804 RNA is designated SEQ ID:4386, and is provided hereinbelow with reference to the sequence listing part.

[25130] GAM1804 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1804 target RNA, herein designated GAM TARGET RNA. GAM1804 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25131] GAM1804 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1804 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1804 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1804 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1804 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25132] The complementary binding of GAM1804 RNA, herein designated GAM RNA, to target binding sites on GAM1804 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1804 target RNA, herein designated GAM TARGET RNA, into GAM1804 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25133] It is appreciated that GAM1804 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1804 target genes. The

mRNA of each one of this plurality of GAM1804 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1804 RNA, herein designated GAM RNA, and which when bound by GAM1804 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1804 target proteins.

[25134] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1804 gene, herein designated GAM GENE, on one or more GAM1804 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25135] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1804 correlate with, and may be deduced from, the identity of the target genes which GAM1804 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25136] Nucleotide sequences of the GAM1804 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1804 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1804 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1804 are further described hereinbelow with reference to Table 1.

[25137] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1804 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25138] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1805 (GAM1805) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25139] GAM1805 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1805 was detected is described hereinabove with reference to Figs. 2-8.

[25140] GAM1805 gene, herein designated GAM GENE, and GAM1805 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25141] GAM1805 gene, herein designated GAM GENE, encodes a GAM1805 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1805 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1805 precursor RNA is designated SEQ ID:1782, and is provided hereinbelow with reference to the sequence listing part.

[25142] GAM1805 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1805 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25143] An enzyme complex designated DICER COMPLEX, dices the GAM1805 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1805 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1805 RNA is designated SEQ ID:4387, and is provided hereinbelow with reference to the sequence listing part.

[25144] GAM1805 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1805 target RNA, herein designated GAM TARGET RNA. GAM1805 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25145] GAM1805 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1805 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1805 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1805 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1805 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25146] The complementary binding of GAM1805 RNA, herein designated GAM RNA, to target binding sites on GAM1805 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1805 target RNA, herein designated GAM TARGET RNA, into GAM1805 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25147] It is appreciated that GAM1805 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1805 target genes. The mRNA of each one of this plurality of GAM1805 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1805 RNA, herein designated GAM RNA, and which when bound by GAM1805 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1805 target proteins.

[25148] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1805 gene, herein designated GAM GENE, on one or more GAM1805 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25149] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1805 correlate with, and may be deduced from, the identity of the target

genes which GAM1805 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25150] Nucleotide sequences of the GAM1805 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1805 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1805 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1805 are further described hereinbelow with reference to Table 1.

[25151] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1805 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25152] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1806 (GAM1806) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25153] GAM1806 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1806 was detected is described hereinabove with reference to Figs. 2-8.

[25154] GAM1806 gene, herein designated GAM GENE, and GAM1806 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[25155] GAM1806 gene, herein designated GAM GENE, encodes a GAM1806 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1806 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1806 precursor RNA is designated SEQ ID:1783, and is provided hereinbelow with reference to the sequence listing part.

[25156] GAM1806 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1806 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25157] An enzyme complex designated DICER COMPLEX, dices the GAM1806 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1806 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1806 RNA is designated SEQ ID:4388, and is provided

hereinbelow with reference to the sequence listing part.

[25158] GAM1806 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1806 target RNA, herein designated GAM TARGET RNA. GAM1806 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25159] GAM1806 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1806 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1806 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1806 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1806 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25160] The complementary binding of GAM1806 RNA, herein designated GAM RNA, to target binding sites on GAM1806 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1806 target RNA, herein designated GAM TARGET RNA, into GAM1806 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25161] It is appreciated that GAM1806 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1806 target genes. The mRNA of each one of this plurality of GAM1806 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1806 RNA, herein designated GAM RNA, and which when bound by GAM1806 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1806 target proteins.

[25162] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1806 gene, herein designated GAM GENE, on one or more GAM1806 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25163] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1806 correlate with, and may be deduced from, the identity of the target genes which GAM1806 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25164] Nucleotide sequences of the GAM1806 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1806 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1806 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1806 are further described hereinbelow with reference to Table 1.

[25165] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1806 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25166] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1807 (GAM1807) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25167] GAM1807 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1807 was detected is described hereinabove with reference to Figs. 2-8.

[25168] GAM1807 gene, herein designated GAM GENE, and GAM1807 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25169] GAM1807 gene, herein designated GAM GENE, encodes a GAM1807 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1807 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1807 precursor RNA is designated SEQ ID:1784, and is provided hereinbelow with reference to the sequence listing part.

[25170] GAM1807 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25171] An enzyme complex designated DICER COMPLEX, dices the GAM1807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1807 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1807 RNA is designated SEQ ID:4389, and is provided hereinbelow with reference to the sequence listing part.

[25172] GAM1807 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1807 target RNA, herein designated GAM TARGET RNA. GAM1807 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25173] GAM1807 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1807 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1807 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1807 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1807 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25174] The complementary binding of GAM1807 RNA, herein designated GAM RNA, to target binding sites on GAM1807 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1807 target RNA, herein designated GAM TARGET RNA, into GAM1807 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25175] It is appreciated that GAM1807 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1807 target genes. The mRNA of each one of this plurality of GAM1807 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1807 RNA, herein designated GAM RNA, and which when bound by GAM1807 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1807 target proteins.

[25176] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1807 gene, herein designated GAM GENE, on one or more GAM1807 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25177] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1807 correlate with, and may be deduced from, the identity of the target genes which GAM1807 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25178] Nucleotide sequences of the GAM1807 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1807 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1807 are further described hereinbelow with reference to Table 1.

[25179] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1807 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25180] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1808 (GAM1808) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25181] GAM1808 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1808 was detected is described hereinabove with reference to Figs. 2-8.

[25182] GAM1808 gene, herein designated GAM GENE, and GAM1808 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25183] GAM1808 gene, herein designated GAM GENE, encodes a GAM1808 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1808 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1808 precursor RNA is designated SEQ ID:1785, and is provided hereinbelow with reference to the sequence listing part.

[25184] GAM1808 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1808 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25185] An enzyme complex designated DICER COMPLEX, dices the GAM1808 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1808 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1808 RNA is designated SEQ ID:4390, and is provided hereinbelow with reference to the sequence listing part.

[25186] GAM1808 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1808 target RNA, herein designated GAM TARGET RNA. GAM1808 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25187] GAM1808 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1808 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1808 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1808 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1808 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25188] The complementary binding of GAM1808 RNA, herein designated GAM RNA, to target binding sites on GAM1808 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1808 target RNA, herein designated GAM TARGET RNA, into GAM1808 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25189] It is appreciated that GAM1808 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1808 target genes. The mRNA of each one of this plurality of GAM1808 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1808 RNA, herein designated GAM RNA, and which when bound by GAM1808 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1808 target proteins.

[25190] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1808 gene, herein designated GAM GENE, on one or more GAM1808 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25191] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1808 correlate with, and may be deduced from, the identity of the target genes which GAM1808 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25192] Nucleotide sequences of the GAM1808 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1808 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1808 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1808 are further described hereinbelow with reference to Table 1.

[25193] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1808 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[25194] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1809 (GAM1809) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25195] GAM1809 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1809 was detected is described hereinabove with reference to Figs. 2-8.

[25196] GAM1809 gene, herein designated GAM GENE, and GAM1809 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25197] GAM1809 gene, herein designated GAM GENE, encodes a GAM1809 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1809 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1809 precursor RNA is designated SEQ ID:1786, and is provided hereinbelow with reference to the sequence listing part.

[25198] GAM1809 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1809 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25199] An enzyme complex designated DICER COMPLEX, dices the GAM1809 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1809 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1809 RNA is designated SEQ ID:4391, and is provided hereinbelow with reference to the sequence listing part.

[25200] GAM1809 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1809 target RNA, herein designated GAM TARGET RNA. GAM1809 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25201] GAM1809 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1809 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1809 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1809 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1809 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25202] The complementary binding of GAM1809 RNA, herein designated GAM RNA, to target binding sites on GAM1809 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1809 target RNA, herein designated GAM TARGET RNA, into GAM1809 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25203] It is appreciated that GAM1809 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1809 target genes. The mRNA of each one of this plurality of GAM1809 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1809 RNA, herein designated GAM RNA, and which when bound by GAM1809 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1809 target proteins.

[25204] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1809 gene, herein designated GAM GENE, on one or more GAM1809 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25205] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1809 correlate with, and may be deduced from, the identity of the target genes which GAM1809 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25206] Nucleotide sequences of the GAM1809 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1809 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1809 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1809 are further described hereinbelow with reference to Table 1.

[25207] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1809 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25208] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1810 (GAM1810) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25209] GAM1810 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1810 was detected is described hereinabove with reference to Figs. 2-8.

[25210] GAM1810 gene, herein designated GAM GENE, and GAM1810 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25211] GAM1810 gene, herein designated GAM GENE, encodes a GAM1810 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1810 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1810 precursor RNA is designated SEQ ID:1787, and is provided hereinbelow with reference to the sequence listing part.

[25212] GAM1810 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1810 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25213] An enzyme complex designated DICER COMPLEX, dices the GAM1810 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1810 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1810 RNA is designated SEQ ID:4392, and is provided hereinbelow with reference to the sequence listing part.

[25214] GAM1810 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1810 target RNA, herein designated GAM TARGET RNA. GAM1810 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25215] GAM1810 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1810 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1810 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1810 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1810 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25216] The complementary binding of GAM1810 RNA, herein designated GAM RNA, to target binding sites on GAM1810 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1810 target RNA, herein designated GAM TARGET RNA, into GAM1810 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25217] It is appreciated that GAM1810 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1810 target genes. The

mRNA of each one of this plurality of GAM1810 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1810 RNA, herein designated GAM RNA, and which when bound by GAM1810 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1810 target proteins.

[25218] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1810 gene, herein designated GAM GENE, on one or more GAM1810 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25219] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1810 correlate with, and may be deduced from, the identity of the target genes which GAM1810 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25220] Nucleotide sequences of the GAM1810 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1810 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1810 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1810 are further described hereinbelow with reference to Table 1.

[25221] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1810 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25222] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1811 (GAM1811) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25223] GAM1811 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1811 was detected is described hereinabove with reference to Figs. 2-8.

[25224] GAM1811 gene, herein designated GAM GENE, and GAM1811 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25225] GAM1811 gene, herein designated GAM GENE, encodes a GAM1811 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1811 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1811 precursor RNA is designated SEQ ID:1788, and is provided hereinbelow with reference to the sequence listing part.

[25226] GAM1811 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1811 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25227] An enzyme complex designated DICER COMPLEX, dices the GAM1811 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1811 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1811 RNA is designated SEQ ID:4393, and is provided hereinbelow with reference to the sequence listing part.

[25228] GAM1811 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1811 target RNA, herein designated GAM TARGET RNA. GAM1811 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25229] GAM1811 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1811 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1811 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1811 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1811 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25230] The complementary binding of GAM1811 RNA, herein designated GAM RNA, to target binding sites on GAM1811 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1811 target RNA, herein designated GAM TARGET RNA, into GAM1811 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25231] It is appreciated that GAM1811 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1811 target genes. The mRNA of each one of this plurality of GAM1811 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1811 RNA, herein designated GAM RNA, and which when bound by GAM1811 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1811 target proteins.

[25232] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1811 gene, herein designated GAM GENE, on one or more GAM1811 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25233] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1811 correlate with, and may be deduced from, the identity of the target

genes which GAM1811 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25234] Nucleotide sequences of the GAM1811 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1811 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1811 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1811 are further described hereinbelow with reference to Table 1.

[25235] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1811 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25236] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1812 (GAM1812) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25237] GAM1812 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1812 was detected is described hereinabove with reference to Figs. 2-8.

[25238] GAM1812 gene, herein designated GAM GENE, and GAM1812 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[25239] GAM1812 gene, herein designated GAM GENE, encodes a GAM1812 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1812 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1812 precursor RNA is designated SEQ ID:1789, and is provided hereinbelow with reference to the sequence listing part.

[25240] GAM1812 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1812 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25241] An enzyme complex designated DICER COMPLEX, dices the GAM1812 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1812 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1812 RNA is designated SEQ ID:4395, and is provided

hereinbelow with reference to the sequence listing part.

[25242] GAM1812 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1812 target RNA, herein designated GAM TARGET RNA. GAM1812 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25243] GAM1812 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1812 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1812 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1812 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1812 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25244] The complementary binding of GAM1812 RNA, herein designated GAM RNA, to target binding sites on GAM1812 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1812 target RNA, herein designated GAM TARGET RNA, into GAM1812 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25245] It is appreciated that GAM1812 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1812 target genes. The mRNA of each one of this plurality of GAM1812 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1812 RNA, herein designated GAM RNA, and which when bound by GAM1812 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1812 target proteins.

[25246] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1812 gene, herein designated GAM GENE, on one or more GAM1812 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25247] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1812 correlate with, and may be deduced from, the identity of the target genes which GAM1812 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25248] Nucleotide sequences of the GAM1812 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1812 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1812 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1812 are further described hereinbelow with reference to Table 1.

[25249] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1812 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25250] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1813 (GAM1813) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25251] GAM1813 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1813 was detected is described hereinabove with reference to Figs. 2-8.

[25252] GAM1813 gene, herein designated GAM GENE, and GAM1813 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25253] GAM1813 gene, herein designated GAM GENE, encodes a GAM1813 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1813 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1813 precursor RNA is designated SEQ ID:1790, and is provided hereinbelow with reference to the sequence listing part.

[25254] GAM1813 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1813 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25255] An enzyme complex designated DICER COMPLEX, dices the GAM1813 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1813 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1813 RNA is designated SEQ ID:4394, and is provided hereinbelow with reference to the sequence listing part.

[25256] GAM1813 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1813 target RNA, herein designated GAM TARGET RNA. GAM1813 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25257] GAM1813 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1813 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1813 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1813 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1813 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25258] The complementary binding of GAM1813 RNA, herein designated GAM RNA, to target binding sites on GAM1813 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1813 target RNA, herein designated GAM TARGET RNA, into GAM1813 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25259] It is appreciated that GAM1813 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1813 target genes. The mRNA of each one of this plurality of GAM1813 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1813 RNA, herein designated GAM RNA, and which when bound by GAM1813 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1813 target proteins.

[25260] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1813 gene, herein designated GAM GENE, on one or more GAM1813 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25261] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1813 correlate with, and may be deduced from, the identity of the target genes which GAM1813 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25262] Nucleotide sequences of the GAM1813 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1813 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1813 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1813 are further described hereinbelow with reference to Table 1.

[25263] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1813 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25264] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1814 (GAM1814) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25265] GAM1814 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1814 was detected is described hereinabove with reference to Figs. 2-8.

[25266] GAM1814 gene, herein designated GAM GENE, and GAM1814 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25267] GAM1814 gene, herein designated GAM GENE, encodes a GAM1814 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1814 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1814 precursor RNA is designated SEQ ID:1791, and is provided hereinbelow with reference to the sequence listing part.

[25268] GAM1814 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25269] An enzyme complex designated DICER COMPLEX, dices the GAM1814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1814 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1814 RNA is designated SEQ ID:4396, and is provided hereinbelow with reference to the sequence listing part.

[25270] GAM1814 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1814 target RNA, herein designated GAM TARGET RNA. GAM1814 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25271] GAM1814 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1814 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1814 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1814 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1814 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25272] The complementary binding of GAM1814 RNA, herein designated GAM RNA, to target binding sites on GAM1814 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1814 target RNA, herein designated GAM TARGET RNA, into GAM1814 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25273] It is appreciated that GAM1814 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1814 target genes. The mRNA of each one of this plurality of GAM1814 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1814 RNA, herein designated GAM RNA, and which when bound by GAM1814 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1814 target proteins.

[25274] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1814 gene, herein designated GAM GENE, on one or more GAM1814 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25275] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1814 correlate with, and may be deduced from, the identity of the target genes which GAM1814 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25276] Nucleotide sequences of the GAM1814 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1814 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1814 are further described hereinbelow with reference to Table 1.

[25277] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1814 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[25278] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1815 (GAM1815) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25279] GAM1815 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1815 was detected is described hereinabove with reference to Figs. 2-8.

[25280] GAM1815 gene, herein designated GAM GENE, and GAM1815 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25281] GAM1815 gene, herein designated GAM GENE, encodes a GAM1815 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1815 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1815 precursor RNA is designated SEQ ID:1792, and is provided hereinbelow with reference to the sequence listing part.

[25282] GAM1815 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1815 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25283] An enzyme complex designated DICER COMPLEX, dices the GAM1815 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1815 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1815 RNA is designated SEQ ID:4397, and is provided hereinbelow with reference to the sequence listing part.

[25284] GAM1815 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1815 target RNA, herein designated GAM TARGET RNA. GAM1815 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25285] GAM1815 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1815 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1815 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1815 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1815 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25286] The complementary binding of GAM1815 RNA, herein designated GAM RNA, to target binding sites on GAM1815 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1815 target RNA, herein designated GAM TARGET RNA, into GAM1815 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25287] It is appreciated that GAM1815 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1815 target genes. The mRNA of each one of this plurality of GAM1815 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1815 RNA, herein designated GAM RNA, and which when bound by GAM1815 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1815 target proteins.

[25288] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1815 gene, herein designated GAM GENE, on one or more GAM1815 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25289] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1815 correlate with, and may be deduced from, the identity of the target genes which GAM1815 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25290] Nucleotide sequences of the GAM1815 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1815 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1815 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1815 are further described hereinbelow with reference to Table 1.

[25291] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1815 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25292] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1816 (GAM1816) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25293] GAM1816 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1816 was detected is described hereinabove with reference to Figs. 2-8.

[25294] GAM1816 gene, herein designated GAM GENE, and GAM1816 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25295] GAM1816 gene, herein designated GAM GENE, encodes a GAM1816 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1816 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1816 precursor RNA is designated SEQ ID:1793, and is provided hereinbelow with reference to the sequence listing part.

[25296] GAM1816 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1816 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25297] An enzyme complex designated DICER COMPLEX, dices the GAM1816 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1816 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1816 RNA is designated SEQ ID:4398, and is provided hereinbelow with reference to the sequence listing part.

[25298] GAM1816 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1816 target RNA, herein designated GAM TARGET RNA. GAM1816 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25299] GAM1816 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1816 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1816 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1816 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1816 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25300] The complementary binding of GAM1816 RNA, herein designated GAM RNA, to target binding sites on GAM1816 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1816 target RNA, herein designated GAM TARGET RNA, into GAM1816 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25301] It is appreciated that GAM1816 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1816 target genes. The

mRNA of each one of this plurality of GAM1816 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1816 RNA, herein designated GAM RNA, and which when bound by GAM1816 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1816 target proteins.

[25302] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1816 gene, herein designated GAM GENE, on one or more GAM1816 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25303] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1816 correlate with, and may be deduced from, the identity of the target genes which GAM1816 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25304] Nucleotide sequences of the GAM1816 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1816 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1816 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1816 are further described hereinbelow with reference to Table 1.

[25305] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1816 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25306] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1817 (GAM1817) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25307] GAM1817 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1817 was detected is described hereinabove with reference to Figs. 2-8.

[25308] GAM1817 gene, herein designated GAM GENE, and GAM1817 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25309] GAM1817 gene, herein designated GAM GENE, encodes a GAM1817 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1817 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1817 precursor RNA is designated SEQ ID:1794, and is provided hereinbelow with reference to the sequence listing part.

[25310] GAM1817 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1817 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25311] An enzyme complex designated DICER COMPLEX, dices the GAM1817 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1817 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1817 RNA is designated SEQ ID:4399, and is provided hereinbelow with reference to the sequence listing part.

[25312] GAM1817 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1817 target RNA, herein designated GAM TARGET RNA. GAM1817 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25313] GAM1817 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1817 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1817 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1817 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1817 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25314] The complementary binding of GAM1817 RNA, herein designated GAM RNA, to target binding sites on GAM1817 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1817 target RNA, herein designated GAM TARGET RNA, into GAM1817 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25315] It is appreciated that GAM1817 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1817 target genes. The mRNA of each one of this plurality of GAM1817 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1817 RNA, herein designated GAM RNA, and which when bound by GAM1817 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1817 target proteins.

[25316] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1817 gene, herein designated GAM GENE, on one or more GAM1817 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25317] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1817 correlate with, and may be deduced from, the identity of the target

genes which GAM1817 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25318] Nucleotide sequences of the GAM1817 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1817 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1817 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1817 are further described hereinbelow with reference to Table 1.

[25319] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1817 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25320] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1818 (GAM1818) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25321] GAM1818 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1818 was detected is described hereinabove with reference to Figs. 2-8.

[25322] GAM1818 gene, herein designated GAM GENE, and GAM1818 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[25323] GAM1818 gene, herein designated GAM GENE, encodes a GAM1818 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1818 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1818 precursor RNA is designated SEQ ID:1795, and is provided hereinbelow with reference to the sequence listing part.

[25324] GAM1818 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1818 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25325] An enzyme complex designated DICER COMPLEX, dices the GAM1818 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1818 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1818 RNA is designated SEQ ID:4400, and is provided

hereinbelow with reference to the sequence listing part.

[25326] GAM1818 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1818 target RNA, herein designated GAM TARGET RNA. GAM1818 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25327] GAM1818 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1818 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1818 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1818 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1818 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25328] The complementary binding of GAM1818 RNA, herein designated GAM RNA, to target binding sites on GAM1818 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1818 target RNA, herein designated GAM TARGET RNA, into GAM1818 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25329] It is appreciated that GAM1818 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1818 target genes. The mRNA of each one of this plurality of GAM1818 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1818 RNA, herein designated GAM RNA, and which when bound by GAM1818 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1818 target proteins.

[25330] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1818 gene, herein designated GAM GENE, on one or more GAM1818 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25331] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1818 correlate with, and may be deduced from, the identity of the target genes which GAM1818 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25332] Nucleotide sequences of the GAM1818 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1818 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1818 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1818 are further described hereinbelow with reference to Table 1.

[25333] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1818 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25334] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1819 (GAM1819) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25335] GAM1819 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1819 was detected is described hereinabove with reference to Figs. 2-8.

[25336] GAM1819 gene, herein designated GAM GENE, and GAM1819 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25337] GAM1819 gene, herein designated GAM GENE, encodes a GAM1819 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1819 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1819 precursor RNA is designated SEQ ID:1796, and is provided hereinbelow with reference to the sequence listing part.

[25338] GAM1819 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1819 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25339] An enzyme complex designated DICER COMPLEX, dices the GAM1819 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1819 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1819 RNA is designated SEQ ID:4401, and is provided hereinbelow with reference to the sequence listing part.

[25340] GAM1819 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1819 target RNA, herein designated GAM TARGET RNA. GAM1819 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25341] GAM1819 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1819 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1819 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1819 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1819 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25342] The complementary binding of GAM1819 RNA, herein designated GAM RNA, to target binding sites on GAM1819 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1819 target RNA, herein designated GAM TARGET RNA, into GAM1819 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25343] It is appreciated that GAM1819 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1819 target genes. The mRNA of each one of this plurality of GAM1819 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1819 RNA, herein designated GAM RNA, and which when bound by GAM1819 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1819 target proteins.

[25344] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1819 gene, herein designated GAM GENE, on one or more GAM1819 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25345] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1819 correlate with, and may be deduced from, the identity of the target genes which GAM1819 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25346] Nucleotide sequences of the GAM1819 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1819 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1819 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1819 are further described hereinbelow with reference to Table 1.

[25347] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1819 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25348] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1820 (GAM1820) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25349] GAM1820 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1820 was detected is described hereinabove with reference to Figs. 2-8.

[25350] GAM1820 gene, herein designated GAM GENE, and GAM1820 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25351] GAM1820 gene, herein designated GAM GENE, encodes a GAM1820 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1820 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1820 precursor RNA is designated SEQ ID:1797, and is provided hereinbelow with reference to the sequence listing part.

[25352] GAM1820 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1820 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25353] An enzyme complex designated DICER COMPLEX, dices the GAM1820 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1820 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1820 RNA is designated SEQ ID:4402, and is provided hereinbelow with reference to the sequence listing part.

[25354] GAM1820 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1820 target RNA, herein designated GAM TARGET RNA. GAM1820 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25355] GAM1820 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1820 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1820 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1820 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1820 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25356] The complementary binding of GAM1820 RNA, herein designated GAM RNA, to target binding sites on GAM1820 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1820 target RNA, herein designated GAM TARGET RNA, into GAM1820 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25357] It is appreciated that GAM1820 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1820 target genes. The mRNA of each one of this plurality of GAM1820 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1820 RNA, herein designated GAM RNA, and which when bound by GAM1820 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1820 target proteins.

[25358] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1820 gene, herein designated GAM GENE, on one or more GAM1820 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25359] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1820 correlate with, and may be deduced from, the identity of the target genes which GAM1820 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25360] Nucleotide sequences of the GAM1820 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1820 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1820 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1820 are further described hereinbelow with reference to Table 1.

[25361] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1820 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[25362] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1821 (GAM1821) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25363] GAM1821 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1821 was detected is described hereinabove with reference to Figs. 2-8.

[25364] GAM1821 gene, herein designated GAM GENE, and GAM1821 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25365] GAM1821 gene, herein designated GAM GENE, encodes a GAM1821 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1821 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1821 precursor RNA is designated SEQ ID:1798, and is provided hereinbelow with reference to the sequence listing part.

[25366] GAM1821 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1821 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25367] An enzyme complex designated DICER COMPLEX, dices the GAM1821 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1821 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1821 RNA is designated SEQ ID:4403, and is provided hereinbelow with reference to the sequence listing part.

[25368] GAM1821 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1821 target RNA, herein designated GAM TARGET RNA. GAM1821 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25369] GAM1821 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1821 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1821 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1821 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1821 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25370] The complementary binding of GAM1821 RNA, herein designated GAM RNA, to target binding sites on GAM1821 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1821 target RNA, herein designated GAM TARGET RNA, into GAM1821 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25371] It is appreciated that GAM1821 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1821 target genes. The mRNA of each one of this plurality of GAM1821 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1821 RNA, herein designated GAM RNA, and which when bound by GAM1821 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1821 target proteins.

[25372] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1821 gene, herein designated GAM GENE, on one or more GAM1821 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25373] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1821 correlate with, and may be deduced from, the identity of the target genes which GAM1821 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25374] Nucleotide sequences of the GAM1821 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1821 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1821 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1821 are further described hereinbelow with reference to Table 1.

[25375] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1821 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25376] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1822 (GAM1822) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25377] GAM1822 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1822 was detected is described hereinabove with reference to Figs. 2-8.

[25378] GAM1822 gene, herein designated GAM GENE, and GAM1822 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25379] GAM1822 gene, herein designated GAM GENE, encodes a GAM1822 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1822 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1822 precursor RNA is designated SEQ ID:1799, and is provided hereinbelow with reference to the sequence listing part.

[25380] GAM1822 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1822 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25381] An enzyme complex designated DICER COMPLEX, dices the GAM1822 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1822 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1822 RNA is designated SEQ ID:4404, and is provided hereinbelow with reference to the sequence listing part.

[25382] GAM1822 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1822 target RNA, herein designated GAM TARGET RNA. GAM1822 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25383] GAM1822 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1822 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1822 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1822 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1822 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25384] The complementary binding of GAM1822 RNA, herein designated GAM RNA, to target binding sites on GAM1822 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1822 target RNA, herein designated GAM TARGET RNA, into GAM1822 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25385] It is appreciated that GAM1822 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1822 target genes. The

mRNA of each one of this plurality of GAM1822 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1822 RNA, herein designated GAM RNA, and which when bound by GAM1822 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1822 target proteins.

[25386] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1822 gene, herein designated GAM GENE, on one or more GAM1822 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25387] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1822 correlate with, and may be deduced from, the identity of the target genes which GAM1822 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25388] Nucleotide sequences of the GAM1822 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1822 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1822 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1822 are further described hereinbelow with reference to Table 1.

[25389] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1822 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25390] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1823 (GAM1823) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25391] GAM1823 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1823 was detected is described hereinabove with reference to Figs. 2-8.

[25392] GAM1823 gene, herein designated GAM GENE, and GAM1823 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25393] GAM1823 gene, herein designated GAM GENE, encodes a GAM1823 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1823 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1823 precursor RNA is designated SEQ ID:1800, and is provided hereinbelow with reference to the sequence listing part.

[25394] GAM1823 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1823 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25395] An enzyme complex designated DICER COMPLEX, dices the GAM1823 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1823 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1823 RNA is designated SEQ ID:4405, and is provided hereinbelow with reference to the sequence listing part.

[25396] GAM1823 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1823 target RNA, herein designated GAM TARGET RNA. GAM1823 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25397] GAM1823 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1823 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1823 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1823 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1823 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25398] The complementary binding of GAM1823 RNA, herein designated GAM RNA, to target binding sites on GAM1823 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1823 target RNA, herein designated GAM TARGET RNA, into GAM1823 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25399] It is appreciated that GAM1823 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1823 target genes. The mRNA of each one of this plurality of GAM1823 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1823 RNA, herein designated GAM RNA, and which when bound by GAM1823 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1823 target proteins.

[25400] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1823 gene, herein designated GAM GENE, on one or more GAM1823 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25401] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1823 correlate with, and may be deduced from, the identity of the target

genes which GAM1823 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25402] Nucleotide sequences of the GAM1823 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1823 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1823 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1823 are further described hereinbelow with reference to Table 1.

[25403] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1823 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25404]

[25405] Fig. 8 further provides a conceptual description of a novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1824 (GAM1824) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25406] GAM1824 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1824 was detected is described hereinabove with reference to Figs. 2-8.

[25407] GAM1824 gene, herein designated GAM GENE, and GAM1824 target gene,

herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25408] GAM1824 gene, herein designated GAM GENE, encodes a GAM1824 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1824 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1824 precursor RNA is designated SEQ ID:1801, and is provided hereinbelow with reference to the sequence listing part.

[25409] GAM1824 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1824 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25410] An enzyme complex designated DICER COMPLEX, dices the GAM1824 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1824 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide

sequence of GAM1824 RNA is designated SEQ ID:4406, and is provided hereinbelow with reference to the sequence listing part.

[25411] GAM1824 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1824 target RNA, herein designated GAM TARGET RNA. GAM1824 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25412] GAM1824 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1824 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1824 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1824 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1824 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25413] The complementary binding of GAM1824 RNA, herein designated GAM RNA, to target binding sites on GAM1824 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1824 target RNA, herein designated GAM TARGET RNA, into GAM1824 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25414] It is appreciated that GAM1824 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1824 target genes. The mRNA of each one of this plurality of GAM1824 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1824 RNA, herein designated GAM RNA, and which when bound by GAM1824 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1824 target proteins.

[25415] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1824 gene, herein designated GAM GENE, on one or more GAM1824 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25416] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1824 correlate with, and may be deduced from, the identity of the target genes which GAM1824 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25417] Nucleotide sequences of the GAM1824 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1824 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1824 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1824 are further described hereinbelow with reference to Table 1.

[25418] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1824 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25419] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1825 (GAM1825) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25420] GAM1825 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1825 was detected is described hereinabove with reference to Figs. 2-8.

[25421] GAM1825 gene, herein designated GAM GENE, and GAM1825 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25422] GAM1825 gene, herein designated GAM GENE, encodes a GAM1825 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1825 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1825 precursor RNA is designated SEQ ID:1802, and is provided hereinbelow with reference to the sequence listing part.

[25423] GAM1825 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1825 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25424] An enzyme complex designated DICER COMPLEX, dices the GAM1825 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1825 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1825 RNA is designated SEQ ID:4407, and is provided hereinbelow with reference to the sequence listing part.

[25425] GAM1825 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1825 target RNA, herein designated GAM TARGET RNA. GAM1825 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25426] GAM1825 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1825 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1825 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1825 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1825 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25427] The complementary binding of GAM1825 RNA, herein designated GAM RNA, to target binding sites on GAM1825 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1825 target RNA, herein designated GAM TARGET RNA, into GAM1825 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25428] It is appreciated that GAM1825 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1825 target genes. The mRNA of each one of this plurality of GAM1825 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1825 RNA, herein designated GAM RNA, and which when bound by GAM1825 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1825 target proteins.

[25429] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1825 gene, herein designated GAM GENE, on one or more GAM1825 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25430] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1825 correlate with, and may be deduced from, the identity of the target genes which GAM1825 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25431] Nucleotide sequences of the GAM1825 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1825 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1825 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1825 are further described hereinbelow with reference to Table 1.

[25432] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1825 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25433] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1826 (GAM1826) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25434] GAM1826 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1826 was detected is described hereinabove with reference to Figs. 2-8.

[25435] GAM1826 gene, herein designated GAM GENE, and GAM1826 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25436] GAM1826 gene, herein designated GAM GENE, encodes a GAM1826 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1826 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1826 precursor RNA is designated SEQ ID:1803, and is provided hereinbelow with reference to the sequence listing part.

[25437] GAM1826 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1826 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25438] An enzyme complex designated DICER COMPLEX, dices the GAM1826 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1826 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1826 RNA is designated SEQ ID:4408, and is provided hereinbelow with reference to the sequence listing part.

[25439] GAM1826 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1826 target RNA, herein designated GAM TARGET RNA. GAM1826 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25440] GAM1826 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1826 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1826 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1826 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1826 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25441] The complementary binding of GAM1826 RNA, herein designated GAM RNA, to target binding sites on GAM1826 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1826 target RNA, herein designated GAM TARGET RNA, into GAM1826 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25442] It is appreciated that GAM1826 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1826 target genes. The mRNA of each one of this plurality of GAM1826 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1826 RNA, herein designated GAM RNA, and which when bound by GAM1826 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1826 target proteins.

[25443] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1826 gene, herein designated GAM GENE, on one or more GAM1826 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25444] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1826 correlate with, and may be deduced from, the identity of the target genes which GAM1826 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25445] Nucleotide sequences of the GAM1826 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1826 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1826 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1826 are further described hereinbelow with reference to Table 1.

[25446] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1826 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[25447] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1827 (GAM1827) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25448] GAM1827 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1827 was detected is described hereinabove with reference to Figs. 2-8.

[25449] GAM1827 gene, herein designated GAM GENE, and GAM1827 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25450] GAM1827 gene, herein designated GAM GENE, encodes a GAM1827 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1827 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1827 precursor RNA is designated SEQ ID:1804, and is provided hereinbelow with reference to the sequence listing part.

[25451] GAM1827 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1827 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25452] An enzyme complex designated DICER COMPLEX, dices the GAM1827 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1827 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM1827 RNA is designated SEQ ID:4409, and is provided hereinbelow with reference to the sequence listing part.

[25453] GAM1827 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1827 target RNA, herein designated GAM TARGET RNA. GAM1827 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25454] GAM1827 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1827 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1827 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1827 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1827 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25455] The complementary binding of GAM1827 RNA, herein designated GAM RNA, to target binding sites on GAM1827 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1827 target RNA, herein designated GAM TARGET RNA, into GAM1827 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25456] It is appreciated that GAM1827 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1827 target genes. The mRNA of each one of this plurality of GAM1827 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1827 RNA, herein designated GAM RNA, and which when bound by GAM1827 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1827 target proteins.

[25457] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1827 gene, herein designated GAM GENE, on one or more GAM1827 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25458] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1827 correlate with, and may be deduced from, the identity of the target genes which GAM1827 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25459] Nucleotide sequences of the GAM1827 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1827 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1827 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1827 are further described hereinbelow with reference to Table 1.

[25460] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1827 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25461] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1828 (GAM1828) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25462] GAM1828 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1828 was detected is described hereinabove with reference to Figs. 2-8.

[25463] GAM1828 gene, herein designated GAM GENE, and GAM1828 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25464] GAM1828 gene, herein designated GAM GENE, encodes a GAM1828 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1828 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1828 precursor RNA is designated SEQ ID:1805, and is provided hereinbelow with reference to the sequence listing part.

[25465] GAM1828 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1828 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25466] An enzyme complex designated DICER COMPLEX, dices the GAM1828 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1828 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1828 RNA is designated SEQ ID:4410, and is provided hereinbelow with reference to the sequence listing part.

[25467] GAM1828 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1828 target RNA, herein designated GAM TARGET RNA. GAM1828 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25468] GAM1828 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1828 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1828 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1828 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1828 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25469] The complementary binding of GAM1828 RNA, herein designated GAM RNA, to target binding sites on GAM1828 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1828 target RNA, herein designated GAM TARGET RNA, into GAM1828 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25470] It is appreciated that GAM1828 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1828 target genes. The

mRNA of each one of this plurality of GAM1828 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1828 RNA, herein designated GAM RNA, and which when bound by GAM1828 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1828 target proteins.

[25471] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1828 gene, herein designated GAM GENE, on one or more GAM1828 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25472] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1828 correlate with, and may be deduced from, the identity of the target genes which GAM1828 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25473] Nucleotide sequences of the GAM1828 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1828 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1828 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1828 are further described hereinbelow with reference to Table 1.

[25474] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1828 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25475] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1829 (GAM1829) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25476] GAM1829 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1829 was detected is described hereinabove with reference to Figs. 2-8.

[25477] GAM1829 gene, herein designated GAM GENE, and GAM1829 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25478] GAM1829 gene, herein designated GAM GENE, encodes a GAM1829 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1829 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1829 precursor RNA is designated SEQ ID:1806, and is provided hereinbelow with reference to the sequence listing part.

[25479] GAM1829 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1829 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25480] An enzyme complex designated DICER COMPLEX, dices the GAM1829 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1829 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1829 RNA is designated SEQ ID:4411, and is provided hereinbelow with reference to the sequence listing part.

[25481] GAM1829 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1829 target RNA, herein designated GAM TARGET RNA. GAM1829 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25482] GAM1829 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1829 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1829 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1829 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1829 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25483] The complementary binding of GAM1829 RNA, herein designated GAM RNA, to target binding sites on GAM1829 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1829 target RNA, herein designated GAM TARGET RNA, into GAM1829 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25484] It is appreciated that GAM1829 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1829 target genes. The mRNA of each one of this plurality of GAM1829 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1829 RNA, herein designated GAM RNA, and which when bound by GAM1829 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1829 target proteins.

[25485] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1829 gene, herein designated GAM GENE, on one or more GAM1829 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25486] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1829 correlate with, and may be deduced from, the identity of the target

genes which GAM1829 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25487] Nucleotide sequences of the GAM1829 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1829 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1829 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1829 are further described hereinbelow with reference to Table 1.

[25488] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1829 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25489] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1830 (GAM1830) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25490] GAM1830 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1830 was detected is described hereinabove with reference to Figs. 2-8.

[25491] GAM1830 gene, herein designated GAM GENE, and GAM1830 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[25492] GAM1830 gene, herein designated GAM GENE, encodes a GAM1830 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1830 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1830 precursor RNA is designated SEQ ID:1807, and is provided hereinbelow with reference to the sequence listing part.

[25493] GAM1830 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1830 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25494] An enzyme complex designated DICER COMPLEX, dices the GAM1830 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1830 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1830 RNA is designated SEQ ID:4412, and is provided

hereinbelow with reference to the sequence listing part.

[25495] GAM1830 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1830 target RNA, herein designated GAM TARGET RNA. GAM1830 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25496] GAM1830 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1830 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1830 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1830 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1830 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25497] The complementary binding of GAM1830 RNA, herein designated GAM RNA, to target binding sites on GAM1830 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1830 target RNA, herein designated GAM TARGET RNA, into GAM1830 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25498] It is appreciated that GAM1830 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1830 target genes. The mRNA of each one of this plurality of GAM1830 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1830 RNA, herein designated GAM RNA, and which when bound by GAM1830 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1830 target proteins.

[25499] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1830 gene, herein designated GAM GENE, on one or more GAM1830 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25500] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1830 correlate with, and may be deduced from, the identity of the target genes which GAM1830 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25501] Nucleotide sequences of the GAM1830 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1830 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1830 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1830 are further described hereinbelow with reference to Table 1.

[25502] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1830 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25503] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1831 (GAM1831) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25504] GAM1831 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1831 was detected is described hereinabove with reference to Figs. 2-8.

[25505] GAM1831 gene, herein designated GAM GENE, and GAM1831 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25506] GAM1831 gene, herein designated GAM GENE, encodes a GAM1831

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1831 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1831 precursor RNA is designated SEQ ID:1808, and is provided hereinbelow with reference to the sequence listing part.

[25507] GAM1831 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1831 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25508] An enzyme complex designated DICER COMPLEX, dices the GAM1831 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1831 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1831 RNA is designated SEQ ID:4413, and is provided hereinbelow with reference to the sequence listing part.

[25509] GAM1831 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM1831 target RNA, herein designated GAM TARGET RNA. GAM1831 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[25510] GAM1831 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1831 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1831 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1831 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1831 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[25511] The complementary binding of GAM1831 RNA, herein designated GAM RNA, to target binding sites on GAM1831 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of GAM1831 target RNA, herein designated GAM TARGET RNA, into GAM1831 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[25512] It is appreciated that GAM1831 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1831 target genes. The mRNA of each one of this plurality of GAM1831 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1831 RNA, herein designated GAM RNA, and which when bound by GAM1831 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1831 target proteins.

[25513] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1831 gene, herein designated GAM GENE, on one or more GAM1831 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[25514] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1831 correlate with, and may be deduced from, the identity of the target genes which GAM1831 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[25515] Nucleotide sequences of the GAM1831 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1831 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1831 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1831 are further described hereinbelow with reference to Table 1.

[25516] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1831 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[25517] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1832 (GAM1832) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[25518] GAM1832 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1832 was detected is described hereinabove with reference to Figs. 2-8.

[25519] GAM1832 gene, herein designated GAM GENE, and GAM1832 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[25520] GAM1832 gene, herein designated GAM GENE, encodes a GAM1832 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1832 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1832 precursor RNA is designated SEQ ID:1809, and is provided hereinbelow with reference to the sequence listing part.

[25521] GAM1832 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1832 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[25522] An enzyme complex designated DICER COMPLEX, dices the GAM1832 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1832 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1832 RNA is designated SEQ ID:4414, and is provided hereinbelow with reference to the sequence listing part.

[25523] GAM1832 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1832 target RNA, herein designated GAM TARGET RNA. GAM1832 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
